

#### Mexican Gray Wolf

July 24, 2019
New Mexico State Game Commission Meeting
Socorro, NM

### History of Mexican Wolf

- Most genetically distinct subspecies of North American Gray Wolves
- Core population in the montane woodlands of Southern NM/AZ and Northern Mexico
- Extirpated from the US in the early 1970's
- Listed as an endangered species in 1976
- Captive breeding program established in 1977 to 1980

### Captive Breeding

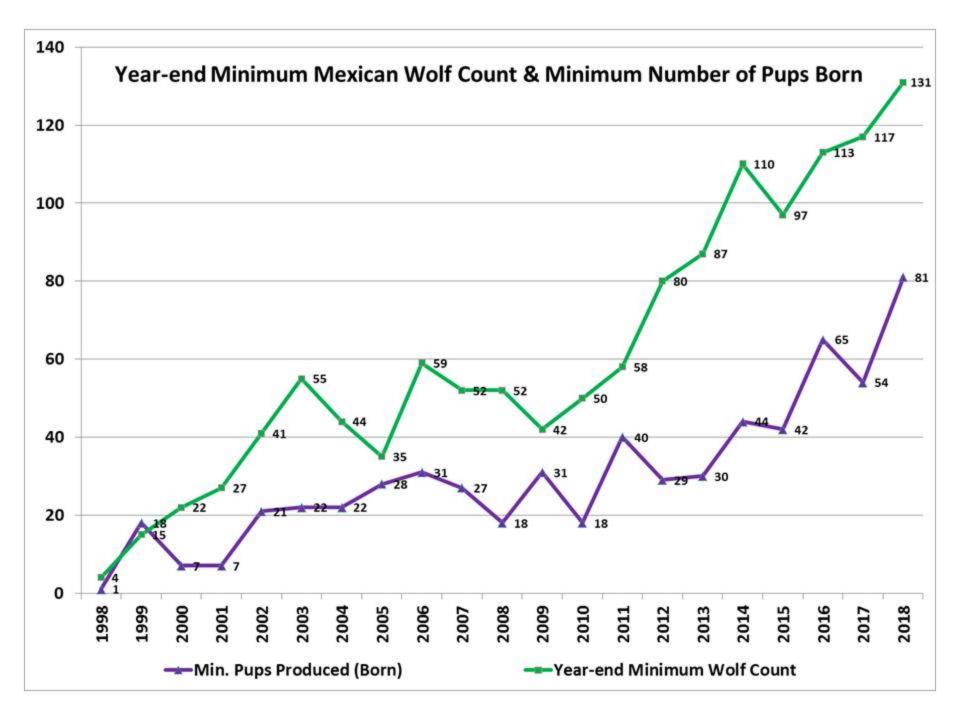

- Created with the last remaining wild wolves
- 51 facilities across US/Mexico
- 3 Pre-release facilities in the US
- Originally source for re-establishing populations
- Today provide for inserting genetic diversity into wild population

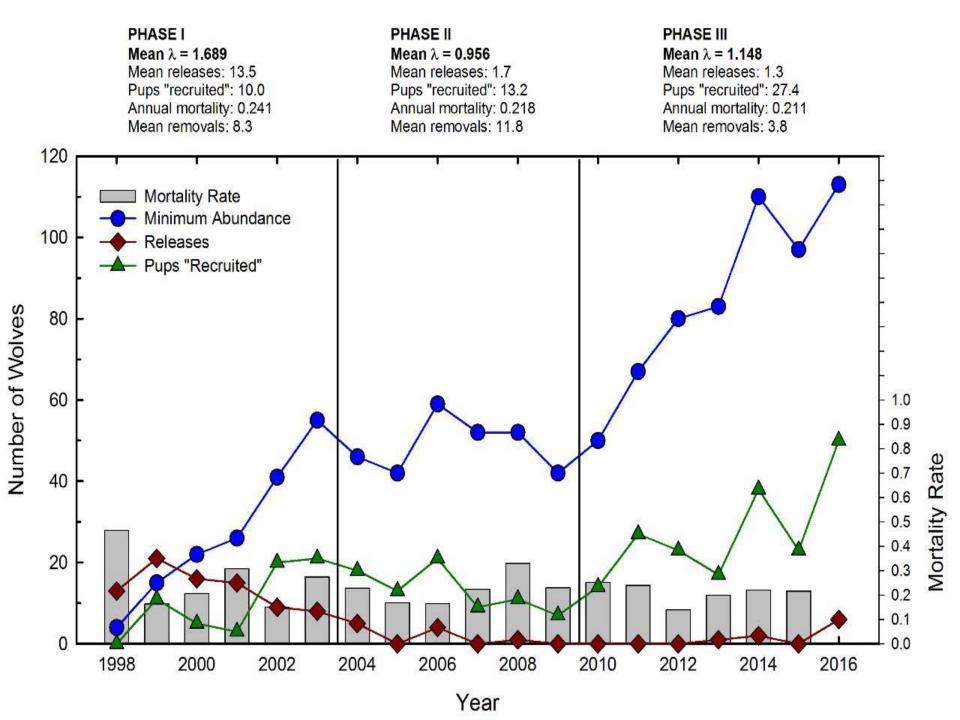

## Wild Population US

### Initial Releases

0	2010	5	2004	13	1998
. 0	2011	0	2005	21	1999
0	2012	4	2006	16	2000
1	2013	0	2007	15	2001
2	2014	1	2008	9	2002
1	2015	0	2009	8	2003
6 6	2016				
4	2017				
8 8	2018				
12	2019				

### Cross fosters

- 32 pups born (or conceived) in captivity released into wild dens since 2014
- Minimum of 9 pups out of 20 (45%) were recruited into the population
- Minimum 4 out of 12 survived to breading age (33%)
- 3 out of 4 breeding age animals have produced offspring
  - Minimum 18 pups produced\*
  - Have started reproducing at age 2

## Wild Population MX

**Photo Credit: Carlos A Lopez Gonzalez** 

#### Recovery in Mexico

- Approximately 30 alive in the wild in Mexico
- Annual releases 2011-2018
- ~45 wolves released since 2011.
- Minimum of 19 pups documented
- One pack with 4 consecutive litters in the wild

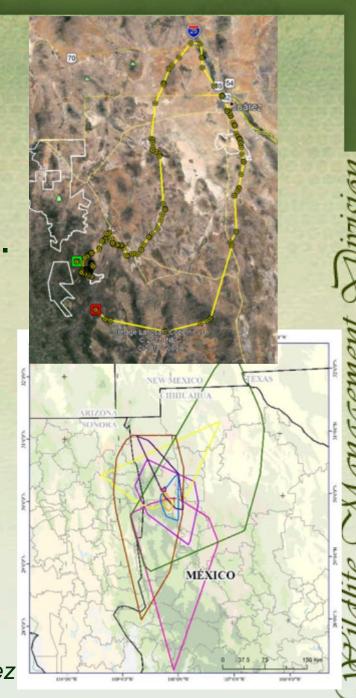

#### Recovery in Mexico

- At least 2 collared wolves have entered the US.
- Two uncollared wolves documented near border (outside Ciudad Juarez).
- Juveniles dispersing and forming new packs.
- Recovery in Mexico tracking similarly to the early years in AZ/NM
- Wild born animals survival much higher.
- Mexico has more releases planned

Photos and information: Carlos Lopez

#### Management Hurdles

- Movement of animals across international border
- Permitting issues

#### **Recovery Plans**

- Written in 1982
- No delisting criteria
- No population goal

Determine necessary numbers

#### Recovery Criteria

# Minimum of two populations meeting abundance and genetic criteria

#### **United States**

- a) Average population abundance is ≥ 320 over 8 consecutive years
- b) The genetic diversity available from the captive population has been incorporated into the population so that 22 released wolves have survived to breeding age.

#### Mexico

- a) Northern Sierra Madre Occidental average population abundance is ≥ 200 over 8 consecutive years
- b) The genetic diversity available from the captive population has been incorporated into the population so that 37 released wolves have survived to breeding age.

#### ABSTRACT

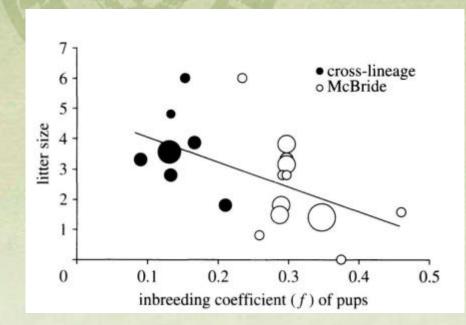

The Mexican wolf (Canis lupus baileyi) was included in the 1973 Endangered Species Act listing of the gray wolf (C. lupus), but then listed separately as a subspecies in 2015. Early accounts of its range included the Sierra Madre Occidental of Mexico, southeastern Arizona, southwestern New Mexico, and sometimes western Texas, supported by ecological, biogeographic, and morphological data. There have been multiple unsuccessful attempts to revise the original 1982 recovery plan and identify areas suitable for Mexican wolf reintroduction.

## Population status

- First release 2011 Sonora; 2012
   Chihuahua
- First wild born litter produced in 2014
- First natural wild park producing a litter 2017
- Approximately 30 wolves in the wild
- A minimum of two pairs producing pups in 2019

#### Genetic rescue and inbreeding depression in Mexican wolves

Although inbreeding can reduce individual fitness and contribute to population extinction, gene flow between inbred but unrelated populations may overcome these effects. Among extant Mexican wolves ( $Ganis\ lupus\ baileyi$ ), inbreeding had reduced genetic diversity and potentially lowered fitness, and as a result, three unrelated captive wolf lineages were merged beginning in 1995. We examined the effect of inbreeding and the merging of the founding lineages on three fitness traits in the captive population and on litter size in the reintroduced population. We found little evidence of inbreeding depression among captive wolves of the founding lineages, but large fitness increases, genetic rescue, for all traits examined among  $F_1$  offspring of the founding lineages. In addition, we observed strong inbreeding depression among wolves descended from  $F_1$  wolves. These results suggest a high load of delererious alleles in the McBeide lineage, the largest of the founding lineages. In the wild, reintroduced population, there were large fitness differences between McBride wolves and wolves with ancestry from two or more lineages, again indicating a genetic rescue. The low litter and pack sizes observed in the wild population are consistent with this genetic load, but it appears that there is still potential to establish vigorous wild populations.

Keywords: conservation genetics; genetic rescue; inbreeding; inbreeding depression; wolves

#### 1. INTRODUCTION

Inbreeding reduces the fitness of wild (Keller & Waller 2002), captive (Ralls et al. 1988) and experimental populations (Lacy et al. 1996), and increases the risk of population extinction (Newman & Pilson 1997; Saccheri et al. 1998). Inbred populations may have fitness restored by immigration of unrelated individuals (Wang et al. 1999; Whitlock et al. 2000), a phenomenon termed 'genetic rescue' (Tallmon et al. 2004). Support for genetic rescue comes from experiments in which fitness was increased following translocation of outbred individuals into small, declining wild populations with low fitness (Westerneier et al. 1998; Madsen et al. 1999, 2004; Hogg et al. 2006). Populations with a history of small size may have a high fixed, or nearly fixed, load of deleterious alleles, and the detrimental effect of additional inbreeding may be limited (Hedrick 1994; Hedrick & Kalinowski 2000), Small populations isolated from one another, however, are expected to become fixed for deleterious alleles at different loci. In this case, crosses between inbred populations may produce offspring with increased fitness, resulting in genetic rescue. Whereas the effects of inbreeding in small populations may be a cause for concern among conservation managers, the prospect of fitness restoration and reduced extinction risk resulting from renewed gene flow may offer new conservation opportunities.

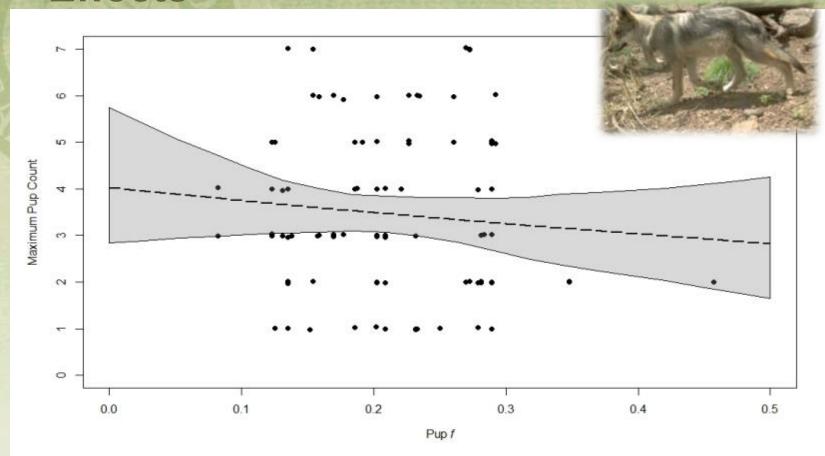

Electronic supplementary material is available at http://dx.doi.org/10. 1098/rspb.2007.0785 or via http://www.journals.royalsoc.ac.uk. Mexican wolf (Canis Inpus baileys), an endangered subspecies of grey wolf, is the most genetically distinct subspecies in North America (Leonard et al. 2005). Human activities throughout its range reduced and isolated Mexican wolf populations such that by 1925 they were rare in the United States (Brown 1983), and by the 1950s their range and numbers in Mexico were greatly reduced (Leopold 1959). By 1980, fewer than 50 wild Mexican wolves were thought to remain in isolated groups spread across four Mexican states (McBride 1980). Surveys in Mexico since then have failed to detect Mexican wolves.

All Mexican wolves alive today originated from three captive lineages founded between 1961 and 1980 by a total of seven wolves (Hedrick et al. 1997). These lineages were managed independently until 1995 when the Aragón and Ghost Ranch lineages were merged into the McBride lineage (Hedrick et al. 1997). By this time, each lineage had accumulated substantial levels of inbreeding (see the electronic supplementary material, figure S1) and the heterozygosity at microsatellite markers was about one half of that observed in northern grey wolves (Wayne & Vila 2003).

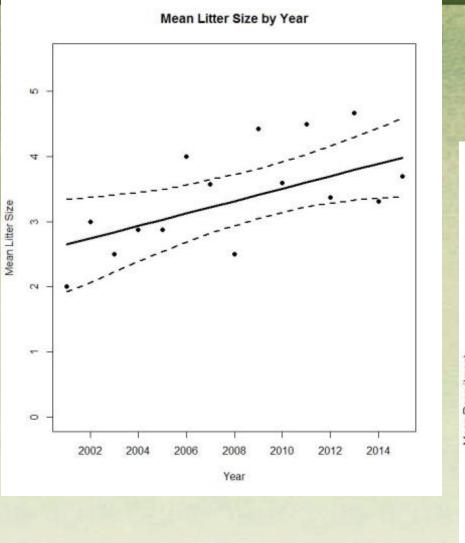

Pairings between lineages began in 1995 with the first  $F_1$  pups (those resulting from pairings between lineages) being born in 1997 (figure S1). Since then,  $F_1$  wolves have been bred among themselves, backcrossed to McBride wolves, and bred with cross-lineage wolves (wolves with ancestry from two or more lineages other than  $F_1$  wolves). The initial goal was for the merged population to have 10% of its ancestry from each of the Aragón and Ghost Ranch lineages. Upon review of the fitness effects of the

# **Updated Analysis of Inbreeding Effects**

89 litters - 1998-2014 (50 more litters and 8 more years)

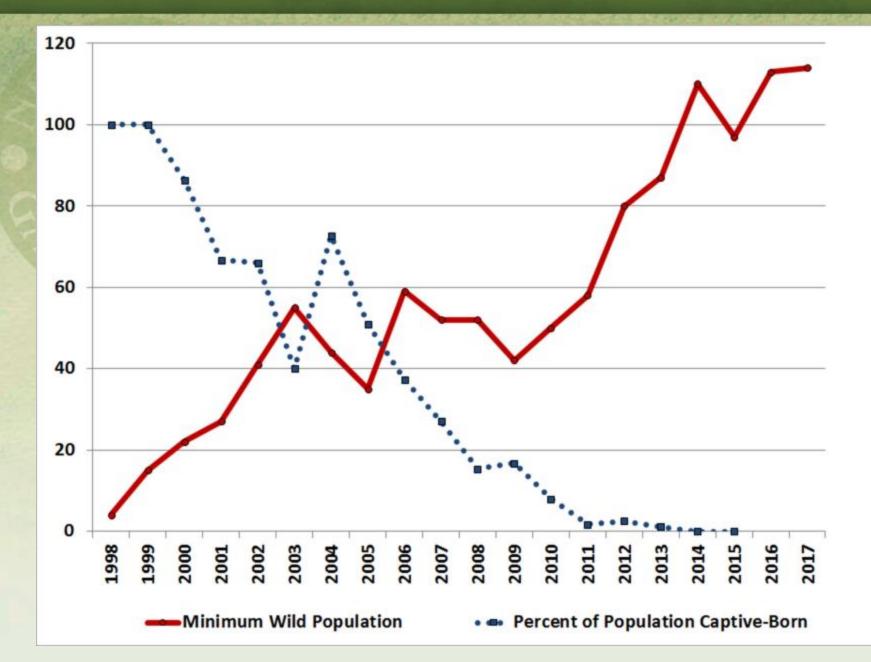

#### **Fate of Captive-raised Wolves**

Individual	Fate
F836	Illegally shot
F1105	Illegally shot near a residence
F1218	Illegally shot
F1106	Lethally removed for nuisance issues
M1130	Lethally removed for nuisance issues
M1133	Removed to captivity for nuisance issues
M1054	Removed to captivity for nuisance issues
M1051	Fate unknown
F1126	Released with M1051 but he split. Female captured with pups, 2 pups cross-fostered into the wild Dark Canyon
	Pack (both now breeders in other packs). Female now dead.

The last 9 cases of captive—raised wolves released (2008-2017), 8 failed to produce offspring that lived 1 year. The only successful genetic contribution were pups from a captive-born female that were cross-fostered and raised by wild pack.

#### Changes from Draft

- 1. Mexico recovery 170 to 200
- 2. Language on the regulatory mech. post delisting
- 3. Clarification on abundance criteria
- 4. No downlisting if MX pop. meet criteria but not US pop.
- 5. Release language

### Recovery Criteria

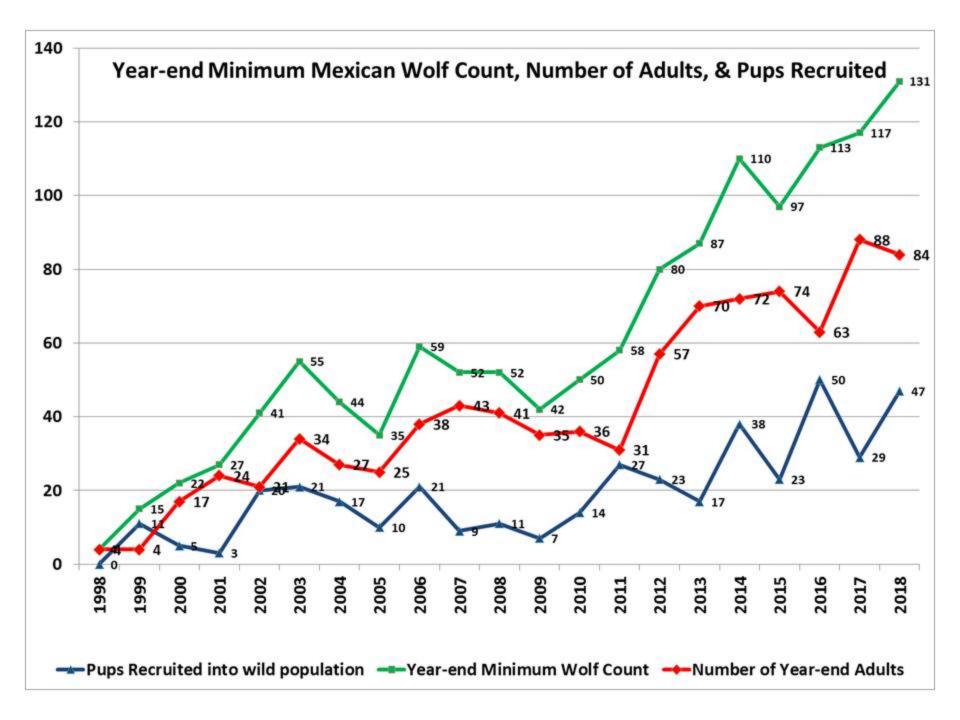

2. Effective state and tribal regulations are in place in the MWEPA in those areas necessary for recovery...Mexico has a proven track record protecting Mexican wolves...

#### Release Language

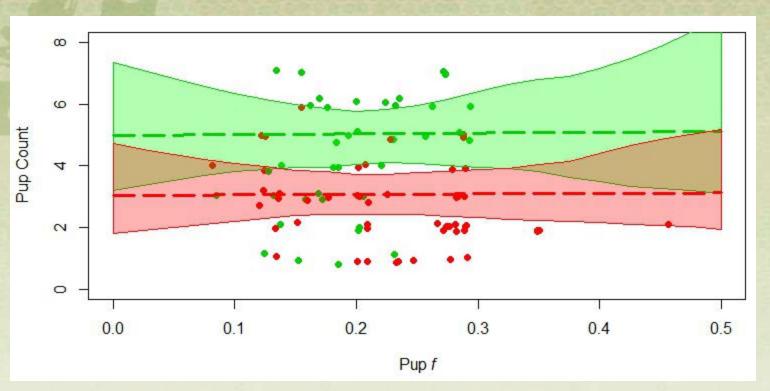

"...will determining the timing, location and circumstances of releases of wolves into the wild ..., from the captive population, with the Service providing collaborative..."

### Release Language

"In order to achieve the genetic criteria ... decisions regarding the timing, location and circumstances of Mexican wolf releases will be based on input from the IFT, and will be made cooperatively by the Service with NMDGF with respect to releases in New Mexico. Additionally, prior to any releases occurring, the Service will comply with state permit requirements pursuant to (i) 43 C.F.R. pt. 24 and (ii) conditions imposed by any permit issued under section 10(a)(1)(A) of the Endangered Species Act, 16 U.S.C. 1539(a)(1)(A)"
