Dear Commissioners,

To be frank, I've never been to NM. That said, it's been one of the states I've looked at for multiple years for potential hunting and recreation options.

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

We respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Sincerely,
Calvin Bueltel

Dear Commissioners,

I support the NMDG&F bear and cougar rule change proposal. The game commission should take some important steps to protect our state's hunting heritage from criticism from non-hunters. During the last legislative session a bill failed to pass that would have required hunters to remove the edible portions of bear, cougar and javelina from the field. Enacting such a requirement would do much to head off anti-hunting sentiment.

The game commission needs to do what it can to enact and support prohibitions on the waste of game including bear and cougar and other game species. Hunting bears and cougars is a longstanding tradition for many New Mexicans and people who travel to New Mexico from across the country. In addition to providing conservation funding, economic benefits from outdoor recreation, being a critical population management tool and bringing families together in the outdoors, the harvest of a bear or cougar provides countless nutritional meals for the lucky hunter and all those he/she shares the bounty with.

Sincerely,
Abran Briseno

Dear Commissioners,

New Mexico state law that spells out the state's bedrock policy of wildlife management. The law calls for providing "an adequate and flexible system for the protection of the game and fish of New Mexico and for their use and development for public recreation and food supply, and to provide for their propagation, planting, protection, regulation and conservation to the extent necessary to provide and maintain an adequate supply of game and fish within the state of New Mexico." It is not only necessary and appropriate for NMDG&F to use scientific based management strategies including hunting to manage predator populations, but it is also the law.

Sincerely,
Kaitlyn Rossing

To Whom It May Concern:

I understand that this department/organization is meeting to discuss raising the number of bears and perhaps "adjusting" the number of cougars that can be hunted each season. With everything going on in this world at this point in time, I have to think that this is not a good idea. Within the recent past years, developers and other industries have and are discovering and building upon New Mexican land at a rapidly increasing pace, thus taking much needed habitat away from these animals. Along with this loss of habitat, the rising temperatures and uncertain water levels from year to year due to climate change, all creatures are stressed and under constant threat. They do not, nor do they deserve, to be under increased pressure from hunters that are only killing for their own ego. Please leave these animals alone to live their lives. We must respect bears, cougars and all the living creatures of New Mexico and not treat them like they are ours for the taking.

Sincerely,
Jennifer Jung

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

My name is Danielle Berd. I live in Rio Rancho. I do not want the bear or cougar tags to increase in any way. I believe that the populations will adjust themselves as their game is abundant or not. With all of the wildfires and heat we have been having, they are having a hard enough time finding food.

I am not a hunter but have worked in many hunting camps as wrangler and cook. 90% of them have a deep respect for wildlife, but there are those who do not. They are only thinking of themselves. I have witnessed a hunter in full camouflage using his pickup to sight over right off a paved road. I was walking my Mom's dog on that road and we often climb around that exact area. He had no qualms about shooting around so much private property.

I appreciate your time and hope you will guide your policies to take care of our natural wildlife first and the wishes of the hunting population 2nd..

Sincerely ,

Danielle Berd, Rio Rancho NM

From: [Ashley White](#)
To: [DGF-Bear-Cougar-Rules](#)
Subject: [EXTERNAL] Changes to bear/cougar hunting
Date: Wednesday, August 16, 2023 11:04:27 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The states predator population is already a problem and was even before the trapping ban.

The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences.

California is the perfect example.

One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. Please do not compromise.

Thank you,
Ashley White

Subject: [EXTERNAL] Changes to cougar and bear kill quotas
Date: Monday, July 17, 2023 1:22:26 PM
Importance: High

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I am firmly against raising the kill quotas for bears, extending the bear hunting season, and “adjusting” kill quotas for cougars.

Game and Fish has not provided sufficient or coherent information about bear or cougar populations that allows the public or even wildlife biologists to judge whether their recommendations are sound.

Not only are these recommended changes ungrounded in science, they are destructive to the ecosystems in question. We need more apex predators like cougars and bears in order to maintain healthy and balanced ecosystems.

Please do not support these changes.

Hello unfortunately we had the date mixed up and did not attend the Albuquerque meeting. What I think need to happen here in NM is have non residents draw bear and Mt lion tags instead of them just showing up and being all over the place like they are now. We need to implement the rules like Utah has on the bear and lion hunts because during our opening days here in Northern New Mexico we are running into a lot of non residents doing pretty much whatever they please and we can't just let them roam around like they do now if they want to hunt bears and lions they need to draw a tag instead of over the counter like it is now.

Thank you
David

I always thought Public land is such a beautiful feature of New Mexico. Until I realized control of the public land can get controlled by the wrong hands. It's such a privilege to have land for everyone to hunt and enjoy. I never thought in my lifetime I would have to worry about not hunting or trapping on state and blm that I have paid taxes and license for my entire life. You need to realize who is paying for all this land and who actually spends their time taking care of the New Mexico Animals. You're gonna to banned these hunts and people will simply move out of your state and go to place where hunting is allowed. Then you will have to increase taxes to make up for all the lost revenue created by hunters. This place will soon look like California. Be nothing but homeless and crooks. It's all starts right here by making one thing illegal at a time. I highly suggest you come to your senses and do not make bear and cougar hunting illegal because next year it will be elk and the next the year will be deer. It's a never ending battle and I'm so sad to see this beautiful land that has been shepherd by the hunters for many generations go to waste for your bleeding heart animal lovers whom doesn't donate a single penny to these animals life's. These people have never installed a water hole or rescued a baby animal from a fence. And these are the people you're choosing to side with simply because of politics and money. Please come to your senses before New Mexico has turned into California and all your good people move off and start their business and invest their money into a state who doesn't outcast the hunters.

Sincerely

Trey Craft

I am fully in favor of predator hunting programs. I have seen the devastation they can do to the deer and elk populations.

I love our New Mexico wildlife, all of them, but just as we need to manage our forests we need to do the same for wildlife. To much of a good thing always has unexpected consequences.

Sincerely,
Lezlie Ziegenfuss

To whomever is collecting public comment on the proposed Bear and Cougar rule.

I would like it to be known that I am in favor of the responsible predator hunt programs and the scientific management proposal submitted by game department biologists in our state.

I believe that these programs help to support 1) a healthy wildlife population in our state and 2) a wave of life and recreation in our state that has been enjoyed for generations.

Thank you for considering my opinion!

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I wanted to write in and voice my support for the slightly expanded limits for Bear and Lion hunting opportunities. With sound data showing sustainable populations, allowing for potentially a slight increase in hunter harvest - this will help ensure populations do not move into less habitable areas. If hunting opportunity were to decrease - bears and lions would still need to be removed at the expense of the agency rather than hunter dollars being put into the agency. I would love to have the opportunity some day to come to New Mexico and hunt either/both a lion and a bear.

Please trust and listen to your biologists and people deeply vested into these species.

Thank you for your time.

Subject: [EXTERNAL] Comment on Bear and Cougar hunting and conservation rules
Date: Sunday, August 20, 2023 4:17:45 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Establishment of rules and regulations regarding hunting and management of bears and cougars (and all wildlife species) in New Mexico should be based on sound scientific and biological research and principles. To establish regulations and restrictions based on a few people's feelings and emotions is ridiculous and detrimental to the well-being of our wildlife. The New Mexico Department of Game and Fish is a professional and highly regarded entity and should not bow to political pressures and nonsensical voices.

In 1990 the state of California banned all mountain lion hunting thanks to the rabid efforts of animal rights activists. The primary food source for cougars is deer. A *single* mountain lion will kill and consume one deer every week on average. According to the Washington Department of Fish and Game an adult female with kittens can kill one deer size prey every 4 days. Without being controlled, mountain lions can decimate an entire deer herd in a matter of months. The California Department of Fish and Game has estimated that statewide deer populations dropped from 850,000 in 1990 to a population of 445,000 in 2011. Of course, these activists don't like to think about the details of how mountain lions (and wolves, and bears) obtain their food. The deer, often young fawns, run in terror as they are chased down, then feel the sharp claws of the cat penetrate their hide into the back. As they are toppled to the ground, the cougar then tears their throat open with fangs backed by vice-like jaws. Not a pretty sight. But the activists are all high fives for they have saved all the mountain lions. A better approach is to let biology and science, not emotion, direct how wild animals are conserved. Let the experts determine, through studies, education, and science, how wildlife (both predators and prey) and their habitat are managed, and state policies developed. Hunting plays a vital role in conservation and is an essential tool for wildlife agencies and biologists to ensure healthy herds and to maintain a balance so that overpopulation doesn't result in disease and starvation.

Sincerely,

David Sprague

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico State Game Commission,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and I support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, I believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

I respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,

Louis J. Newman

Hello!

I am totally opposed to the new rule changes to increase the killing of cougars and bears in New Mexico. A reading of your own summary document indicates you have no actual data to support the increase. Instead, you base the changes on "research studies and statistical modelling efforts" that will be posted at some unannounced date once the research is completed. In other words, you plan on increasing the number of kills based on what you hope the research finds - not on any actual research already available.

My wife and I hike often in the mountains around our home in Los Alamos and we see large numbers of deer and elk. We also see the negative effects of these large numbers. Apparently, there are not enough natural predators (cougars and bears) to keep them in check. Reducing the number of predators will only make the problems worse. Please reconsider this misguided attempt to alter the natural balance of nature in our wonderful state.

Thank you,

Ed Gunderson

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Members of the NM Game and Fish Commission, I am writing today to provide comment on your proposed rules for the next four years of killing New Mexico's bears and cougars.

These proposals are not based on sound data regarding habitat or population estimates for either of these species. The increase or adjustment in quotas and lengthening of the killing season for bears appears to be based solely on the desire to see these animals as trophies on someone's wall. Sound wildlife management would have a detailed management plan detailing measurable objectives for these species based on scientific data subject to rigorous review by outside independent experts and the public. These are the hallmarks of protecting our precious wildlife, none of which form the basis of your proposals to increase quotas or lengthen killing seasons. Loss of apex predators adversely affects the health of our ecosystems. Given the many climate crises we now face, preserving and protecting wildlife is key to protecting and improving the sustainability of our overall environment. Increasing killing quotas and lengthening hunting seasons is at best short sighted and at worst totally out of step with the environmental challenges facing our state. Protecting these animals will help us face these challenges based on sound science and competent wildlife management. Do not increase any quotas or lengthen any killing seasons. Reducing these quotas is what is needed to protect these animals which are essential to protecting our precious ecosystems. These animals are not trophies for someone's wall!!

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I only speak for myself, but as an environmentalist, I would like lower kill quotas not higher for a number of reasons.

- Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.
- Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.
- NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.
- Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited. Moreover, given the newness of these studies, they are only a snapshot of the current population in a given area. We do not yet have long-term on-the-ground field studies of bear and cougar populations throughout the state that could indicate population trends. We do not know the effect of current hunting levels. Absent good data, the department should be exercising great caution with managing the population of bears and cougars.
- Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for 'trophies' and recreation. Ask NM Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.
- It's too hot in August to pursue bears with dogs. The season should not be pushed

back in the southern part of the state and in fact should be pushed forward everywhere because it's only going to get hotter. The same is true for cougar hunting. Dogs for cougars should not be allowed year round. (if they have to be allowed at all it should only be in cooler months.) More broadly speaking, given the fires, the drought and erratic weather going forward caution is in order. It all points to lowering the quotas, not raising them.

- Counting bears and cougars is very difficult. They have density studies But to get a number for the entire population on which the kill quotas are based, they have to apply that density to a land area. How do they decide what land area to use? And what density to use in areas where no studies have been done? Given the uncertainty, the quotas should be more conservative than they are.

Dear NMDGF,

I am writing this in support of our biologists who have recommended or showed that our bear and cougar populations are doing well and can handle and maintain a modest tag increase without any harm to the overall population. I believe it is very important to maintain healthy levels of said predators so that all animals in our beautiful habitats can prosper. We have seen the negative impacts of outlawing or total bans on predator control and what it does to animal populations and increased risk with rising interactions between them and people. It is in the best interest of the state public lands and the people that we continue these common sense practices in maintaining a sustainable and healthy population of any and all species in the state of NM. Thank you for your time.

Date: Friday, July 14, 2023 1:35:57 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I am a senior Santa Fe resident who enjoys hiking and the outdoors. Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for bears and cougars should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years. Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers in the wild. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.

Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless and cruel.

Dear New Mexico State Game Commission,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and I support legal bear and cougar hunting as an appropriate management tool. I would like to voice my agreement with the current proposed changes to the bear and cougar rule.

As both a research scientist professionally, and a hunter, I strongly support the use of science-based population management strategies. In fact, I was not raised a hunter and only became one in part after meeting colleagues (professionals with graduate degrees in biology and related fields) who hunted and explained the benefit that hunting can have to an ecosystem, and its value as an ethical and sustainable source of meat. However, I realize that there are voices from people that oppose the use of hunting for game management. Many of these people often likely vote similarly to myself, yet these are positions that come from a place of emotion and conjecture, rather than science and data.

My purpose in writing is to express a voice of support for using non-politicized, scientific information to shape our game management in New Mexico. I respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,
Zoë

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Hello,

I would like to comment on rule changes for bear and cougar.

I'll start off with commenting on both animals (seasons ,rules, and quotas). As a New Mexico resident guide, houndsman and son of a outfitter we have seen plenty of changes occur throughout the years in this state for bear and lion hunting. Some rules good for us some rules not as good for us being residents. One huge problem we constantly see every year in New Mexico is the amount of out of state outfitters and hunters that come here every season to hunt. The biggest thing we see is for bear season when a outfitter from out of state brings in 5-10 other guides or (friends) with them to NM to help them for the bear season tag out on all their hunters which is fine I understand they are trying to tag out their hunters but what about us residents? It is hard for us residents to even compete with these guys when they have a total of 5-10 other trucks helping them. I think if non resident outfitters come to New Mexico they need to be regulated and not even just outfitters but regular hunters as well. There has been numerous times while hunt both bears and cats where no resident hunters come to New Mexico to hunt since it's pretty much a free for all for them all they need is a valid license to hunt here. The main issue I see with that is they come into NM catch a lion or bear and kill the first thing they catch male female small or big who knows with cats if that female has kittens sometimes they don't always have the kittens with them. I also think one rule the department should think about changing such as our neighbor state like Utah has done is make bear hunting a draw for no residents if NM did that maybe it will help with the outrageous amounts of no residents coming into this state and killing anything they catch. The rule should be if your contracted with a outfitter you can come to hunt lion or bear no problem but if your coming by yourself just catch and kill stuff make it a draw. It sometimes seems as if NMGF just wants more revenue then anything. Something needs to be done on out of state houndsman/outfitters. But knowing NMGF they will not do anything about this, New Mexico will ban hound hunting before anything positive happens for New Mexico houndsman.

Thank you,
Michael Martinez

Date: Wednesday, August 23, 2023 6:27:31 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear NM Game Commissioners,

I fully oppose this proposed rule and believe every effort should be made to enhance protections of NM's bears and cougars.

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced or eliminated, not raised. Kill quotas for both species have been unjustifiably high for many years.

New Mexico is currently experiencing a 20-year "megadrought" and a record heat wave this summer. **Additionally, New Mexico's two record-breaking fires in 2022 consumed over 666,800 acres of primary wildlife habitat.** These cumulative effects of climate change will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates.

Bear and cougar population numbers are extremely hard to count accurately and the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for one year. This snapshot in time tells us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the hallmarks of good science, which the people of NM deserve when it comes to wildlife management, are absent in the hunting rule proposed for bears and cougars. Game and Fish must apply the precautionary principle and cut (or eliminate!), not increase, hunting quotas and seasons to ensure bear

and cougar populations are not negatively affected.

Subject: [EXTERNAL] Comments Regarding the PROPOSED BEAR/COUGAR RULE
Date: Wednesday, August 2, 2023 1:44:12 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

It is my understanding that science plays no part in wildlife management in the state of New Mexico.

The proof of this claim is that the proposed rule on bear and cougar populations will allow the taking of 10% of the population. What bothers the hell out of me is this:

Without knowing what the population of these animals in the state is, how can you define what TEN PERCENT is? That is, **10% of what?**

Let me fill you in on what's happening in Wisconsin regarding wolf management, because I think you need to know some of the parallels and relatedness of these issues in another state's management of its wildlife.

Wisconsin, I'll admit, is a little unusual in its approach to managing Timber wolves. According to state statute if wolves are on the federal Endangered Species list, they fall under the protection of the ESA. However if at any time the population rises above a certain number (I don't exactly know what that number is) then they lose their protection under the ESA. Not only that, but state statute also requires the Wisconsin Department of Natural Resources to enact a hunting season to reduce the wolf population.

The reason I want you to know about this is that the Wisconsin legislature, in requiring a hunting season on wolves when they are not protected under the ESA, is pretending to know how to manage wolves. They claim to have a better idea than the DNR, which is the agency charged with the task of managing Wisconsin wildlife. They claim that they are using science, but there is no science involved in arbitrarily pulling a number out of a hat and saying "We want 407 wolves killed". I would ask these statesmen what science did they use to determine that number? Fact is, there were no howl surveys that they cited, no transects did they run or use any of DNR's data to determine population levels. None of that.

The Wisconsin DNR in the past couple years has put together a SCIENCE-BASED wolf management plan. The final draft of this plan, in fact, was made public in the last week of July.

Back to New Mexico. The Department of Game and Fish is charged with the responsibility of managing New Mexico's wildlife, which is a PUBLIC resource. Bears and cougars and deer don't belong to the DGF, they belong to the people. And as far as I, myself, am concerned, it is put upon you, DGF, to demonstrate that you are the people and agency best equipped to carry out that mandate. So if you are telling me that you don't need science to census the populations, if you don't need science to figure out what the carrying capacity of their range is, if you don't need science to figure out migration/emigration patterns and movements, if you don't need science to figure out what they are eating, if you don't need science to establish kill goals for hunting seasons, then I AM DEEPLY WORRIED that New Mexico sanctions incompetence in the management of its wildlife.

Put another way, by not letting science guide your management, you're telling me that you have no clearer idea of what's going on "out there" than the Wisconsin legislature knows about the state's wolves. To wit, according to the article in the Albuquerque Journal, July 30, C3, *"This policy is highly questionable, but now the game department wants to kill up to a quarter of our bears and cougars every year without any coherent reason. This is a reckless and destructive proposal lacking SCIENTIFIC RIGOR (my emphasis) and ethical competence."*

That is the end of my comment.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

The proposed kill quotas for both bears and cougars cannot be scientifically justified. How the quotas were determined is murky at best. No consideration has been made for rising temperatures, extreme drought, or habitat loss from catastrophic fire. Bears and cougars both evolved to be self regulating. There are not too many. But over-hunting can cause them serious harm and damage.

I strongly oppose raising the kill quota! I find it very disturbing that the issue to raise the quota even came up.

Dear New Mexico State Game Commission,

I am an avid hunter and fisherman in New Mexico. Born and raised here, my family has resided in this state for countless generations. With the changes being proposed, I will continue to purchase licenses for bear and cougar annually to support the conservation initiatives of the NMDGF. It appears to me that the proposed changes represent judicious tweaks, grounded in the expertise and scientific understanding of individuals within the NMDGF. I earnestly hope that these measures endure and are not influenced by external entities that don't financially support NMDGF. Instead, they funnel their money into political pockets to back their ideological stances on hunting.

Our traditions as New Mexicans must be preserved. Hunting and fishing are deeply embedded in not just my family's lineage, but also in the lives of many families throughout our state. Regrettably, trapping was eliminated due to political influences and supposed experts who, in reality, were merely lobbyists for anti-hunting/trapping organizations. This loss was deeply felt, affecting many individuals I know who considered trapping a valuable conservation tool.

We should staunchly adhere to the North American Model and the Public Trust Doctrine. It's disheartening that hunters, despite our substantial contributions to conservation, rarely receive the recognition we deserve. Conversely, anti-hunting groups, while often proclaiming themselves as conservationists, contribute minimally, if at all, to conservation efforts. In my experience, I've yet to see any anti-hunting individuals participate in essential undertakings such as fence projects or water tank projects, which are vital for sustaining healthy wildlife populations.

I implore the State Game Commission to place significant value on the perspectives of those of us who genuinely support conservation and actively assist our wildlife in New Mexico. Furthermore, I hope that the insights and science-driven conclusions of NMDGF biologists and other staff members are given top priority during rule changes, rather than being overshadowed by external influences or politicians who lack genuine commitment to conservation.

Thank you for your time,
Emiliano Martinez

Date: Monday, July 24, 2023 1:59:15 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I would like to submit the following comments on the proposed Bear and Cougar Rules:

The DGF proposal to increase the killing of New Mexico's bears and cougars without knowing how many of these animals exist is poorly supported and reckless. Both bears and cougars are native to New Mexico and belong on the landscape in ecologically significant numbers. These species manage their own populations quite effectively without the need for lethal management.

State wildlife policy should reflect our values as a society. Social attitudes towards wildlife have evolved enormously over the past century. We are largely a mutualistic society now, which means live and let live in some manner of respectful coexistence.

The Game department has not demonstrated what constructive purpose the mass killing of our bears and cougars actually serves. Scientific shortcomings aside, proposals like this demonstrate Game department values that are substantially misaligned with modern society.

The continued recreational killing of wildlife is difficult to justify in an age of mass extinctions, mega-fires, and persistent drought. I believe this proposal is misguided and destructive, and should be dropped.

Mr. Michael Sloane, Director
New Mexico Department of Game & Fish
1 Wildlife Way
Santa Fe, New Mexico 87507

Re: Comments on Proposed Changes to the Bear and Cougar Rule

Dear Director Sloane:

The New Mexico Cattle Growers' Association provides the following comments on the above- referenced proposed changes to the bear and cougar rule.

The New Mexico Cattle Growers' Association's mission is "to advance and protect the cattle industry of New Mexico, work toward solutions of cattle industry problems, promote the wellbeing of the industry, provide an official and united voice on issues of importance to the cattle producers and feeders, and to create and maintain an economic climate that will provide members of the Association the opportunity to obtain optimum return on their investments within the free enterprise system." We have members in 32 of the state's 33 counties as well as in 18 other states.

NMCGA requested input from our members on the proposed changes to the Bear and Cougar Rule. Our members report particular concern with bear and cougar populations and presence in Catron, Colfax, Dona Ana, Grant, Lincoln, Otero and Sierra Counties.

Ranchers report relatively more human encounters with both bear and cougar. That is a significant safety issue for them and their families as well as for the hikers, campers, fishermen and hunters who frequent our rural areas. Those encounters are not limited to the woods. We have had multiple reports of bears near dwellings in rural as well as urban areas.

Ranchers further report that bear and cougar depredations on livestock have become even more prevalent. As we experience long-term drought, these depredations are likely to increase at watering locations.

The Department's proposed rule generally addresses the increase in bear activity in certain hot spots. Respectfully, however, the proposed rule does not appear to sufficiently acknowledge bear activity in Otero County. Nor does the rule address the relative increase in cougar activity in the counties noted above, which gives us pause, particularly in CMZ Q where the Department proposes to essentially cut the limit by half despite reports of relatively more cougar activity in the area. NMCGA urges your consideration of these modifications and if made, NMCGA supports the proposed rule and would urge its adoption.

Sincerely,

Loren Patterson, President

Subject: [EXTERNAL] Comments on bear & cougar game rules
Date: Wednesday, July 19, 2023 1:07:55 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Good afternoon,

I would like to share the following comments on the bear and cougar game rules:

Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.

The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.

Please do not raise the kill quotas for bears, extend bear season, or raise kill quotas for cougars in New Mexico.

Thank you,

- Sara

As a rancher/hunter, we would like to comment on the bear and cougar rule. Our family has ranched in the Guadalupe Mountains for over 100 years. We have documented hundreds of losses to our livestock and wildlife by cougar. The NM Game & Fish collared 13 or 14 lions and several have been killed by other lions which shows over population. The deer population has been destroyed by the lion population. We support the biologists at NM G & F that know hunting with dogs is critical to helping manage the lion population.

Subject: [EXTERNAL] Comments on changes to Bear and Cougar limits
Date: Saturday, July 15, 2023 2:24:23 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Hello,

I am writing in opposition to raising the limits of bear and cougar hunting.
The quotas for both should be reduced, not raised.

There is no certain inventory of population and habitat continues to decrease. Unless a study is done with conclusive proof of the population and viable habitat, no increase should be done. Climate change is already affecting all wildlife and to ignore this with no actual population count is poor management.

Additionally, hunting with dogs is cruel. The dogs tree the cougar or bear and the hunter just comes up and shoots the exhausted animal.

New Mexicans deserve to have our tax dollars, that pay your staff, do scientific, transparent and peer reviewed studies of the populations and effect of climate change on the populations.

Sincerely,
Charmeine Wait

Subject: [EXTERNAL] Comments on hunting of Bears and Cougars
Date: Saturday, July 15, 2023 5:43:07 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I'd like to submit comments about the hunting of bears and cougars, and more broadly, all animals. Wildlife species and individuals are under more pressures than ever before, as humans encroach on wildlands more and more, disrupting many species that act as food for others. Trophy hunting serves no legitimate purpose, and harkens back to crueler times. The killing of animals as "sport" is a revolting idea. Centuries ago, when survival was a motive, it may have been a more realistic concern. In modern times, it is a self aggrandizing behaviour that should be discouraged.

Hunting in general cultivates a heartless attitude towards animals that often carries over to how hunters treat other people. Treating animals as objects does much harm to society. I have met two hunters in my life with similar stories. After years of hunting, both suddenly encountered the realization that they were causing stress and harm to their prey; that the animals were living, feeling, thinking beings. Both hunters chose to no longer use a gun on hunts, instead using a camera.

Personally, I've never understood how a person could simultaneously appreciate the beauty of an animal and then want to kill it. This appears to be much like the thought process of a stereotypical "serial killer" of humans

There is much discussion of how the ability to kill animals with impunity is intrinsic to those individuals that develop into those classified as "serial killers".

In summation, the rules and quotas allowing hunting predators and non-food animals should be replaced entirely with rules that prohibit the hunting of these animals. I urge you to please make it unlawful to kill bears, cougars, bobcats, lynx, wolves, coyotes, foxes, raccoons, weasels, etc.

--

Please go in
peace.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Thank you for the opportunity to comment on the Department of Game and Fish's proposed changes to 19.31.11 NMAC, the bear and cougar rule. I am opposed to the proposed changes. Nothing on the DGF's website pertaining to this rule discloses the reasons why the proposed rule is needed. DGF presents no data that increasing the number of bears and cougars killed in certain "management zones" will protect ecosystems, other wildlife populations, bear and cougar populations or any other rational reason. In other words, the DGF's proposed decision appears entirely arbitrary. DGF should not go forward with the proposed changes unless and until it can present reasons, using the best available scientific data, why increasing the number of bears and cougars that hunters can kill is necessary, and make such data - and the methods used to gather and analyze the data - available to the public on the DGF website.

Sincerely,

Eric Jantz

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I am writing to share my opinion that I strongly oppose increasing the current limit regarding the authorized killing of bears and cougars. As a New Mexico resident with a love of our shared outdoors and our native wildlife, I find the proposed change ethically and scientifically unjustifiable.

While I don't oppose hunting in general, in this case, the proposed change to limits seems to be giving far too much weight to the interests of a relatively small population of recreational hunters, and not nearly enough weight to our shared duty as New Mexicans to protect the wildlife in our state.

Thanks for your consideration.

To Whom This Concerns, The management of all NM game animals and predators must remain in the hands of qualified NMG&F biologists. Big game animal populations are managed through public hunting and hunting of bear and cougar populations. It has been proved that hound hunting is the most efficient way to kill targeted sex and age groups. If there is no bear or cougar hunting and there gets to be too large of any one or more predator populations we would/could lose our elk, pronghorn, sheep and /or deer herds. We already had one elk population go extinct in the Gila. Flip side is when the pray species of any predator gets too low than there is a loss of the predator populations. The loss of trapping small predators, bob cat, fox, coyotes, etc. is going to greatly reduce the small mammal and bird pray species including wild turkey. The cougar also eats (small game) rabbits, skunk etc. So the whole system gets out of whack.

Legislative management is no management at all!!!!

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To Whom it May Concern:

I am reaching out in protest of the new ruling which allows for an increased number of BEAR and COUGAR kills, in addition to lengthening the hunting season.

I am a horse-boarding client of a property that partially borders the hunting range for these animals. During hunting season we often witness the inhumane tracking and killing of these animals by hunters and their dogs. A couple of years ago hunters were tracking a mama bear and cub, and entered this private property to finalize their hunt and were asked to leave. Despite leaving the property, they still managed to claim the life of the mother bear, leaving the cub to fend for itself. The cub managed to hibernate for the winter but came out of this state in very poor shape, and ended up starving to death on this property with no mother to show him the ropes to survival. He died on the property. This story was all but duplicated for a young cougar cub who was left motherless and alone through this selfish and inhumane process.

These animals harm no one as long as they and their habitat are shown respect by the human counterparts who choose to live in their habitat. These creatures do their part in the ecosystem, much better than the majority of their human neighbors. What is the purpose of this inequitable activity? Way of life? Compensation for a lack of self-worth? Machismo, girl power, bravado? Then it's time for a change, in my opinion.

Please allow the natural world to regulate itself, the way it was always intended.

Thank you for your consideration.

Respectfully,

Allen Griffith

As a resident of New Mexico I am completely opposed to the proposed rule to allow up to 25% of bears and cougars in the state. It is not like there are too many of them. It is not like we use them for food. Hunting these predators is an outdated and foolish behavior on the part of we humans, and we need it to stop. Animals have enough to deal with in a time of climate change and destruction of natural habitat. Leave them alone. Even the current 10% limit is too much.

Subject: [EXTERNAL] Concerns About Mountain Lion Hunting Proposal
Date: Monday, October 16, 2023 5:31:12 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Department of Game & Fish,

I write to express my grave concerns regarding the proposed extension of hunting limits on mountain lions in New Mexico. The current hunting practices, where mountain lions are pitted against well-equipped hunters, appear neither ethical nor humane. This approach is particularly troubling considering that known mountain lion deaths have already reached around 10% of the estimated population due to hunting alone. The proposed limits could potentially result in an even greater impact on our iconic mountain lion population.

New Mexico's wildlife, including mountain lions, holds a special place in the hearts of residents and visitors alike. Mountain lions are more than mere targets; they play a vital role as keystone species in our ecosystem. I implore the New Mexico Department of Game & Fish to reconsider these high hunting limits, as they pose a significant threat to the sustainability of our mountain lion population and the enchanting charm of our state. I urge you to take into account the concerns of those who oppose this plan and seek a more sustainable and ethical approach to wildlife management.

Sincerely,
Heidi Goodman

Dear Commissioners,

In reviewing the bear and cougar rule proposals, it's clear that the game department has been responsive to both challenges and successes in wildlife management. Such adaptability is essential to cater to evolving ecosystems and changing societal perspectives. Continue hunting bears and lions in New Mexico based on biology and science, not based on politics or unsound feelings.

Sincerely,
Carl Abrams

Dear Commissioners,

Conservation and wildlife management practices are an evolving discipline that depends on both scientific data and historical context. The changes proposed in the bear and cougar rule reflect a dedication to this balance. The significant contributions made by hunters, anglers, trappers, and recreational shooters, not just in New Mexico but nationally, cannot be overstated. Prioritizing the insights of dedicated department biologists ensures a sustainable and healthy future for all wildlife.

Sincerely,
Cody Sandri

As a lifelong New Mexican, hunter and conservationist I strongly support regulated bear and cougar hunting in addition to the changes being proposed by the NMDGF in the current 2023 rule making session.

It's imperative to put the resource first and use the best available science to make management decisions rather than conjecture and emotion. The methodology used by NMDGF in determining the data used to make these decisions is sound. Current population estimates and on-the-ground depredation reports point to an increasing population, more human wildlife conflict, and the unnecessary expenditure of conservation officer resources that would be better spent protecting our shared wildlife resources. It's important that New Mexico continue to manage predator populations through regulated public hunting and the purchase of licenses that generate rather than diminish revenue for the department and it's critical mission.

Thank you for your consideration,

Marco diGrazia

Hello,

I am reaching out to voice my support for predator hunting programs and the scientific management proposal submitted by game department biologists. It is imperative that game species, including predators, continue to be managed by biologists and that predator hunting continue for species conservation and preservation of our deeply values hunting heritage. Furthermore, critical management opportunities should not be limited by disallowing use of hounds for predator management.

Sincerely,
Ashley Twitty

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear NM DGF;

This message is in response to a notice of rulemaking on the topic of bear hunting in New Mexico.

I continue to object to acceleration of bear hunting in the state, for the same reason expressed in my prior message.

DGF has not provided an ecosystem health argument in favor of increased take. Wildlife in New Mexico is a resource for the entire state and should be managed from that framework. While I don't dismiss the interests of the hunting community, those interests need to be considered in balance with other interests.

DGF has not bothered to provide a broader argument for increased take, rather the agency has made the assumption that any take that can be justified based on population count is a net good. That is insufficient rationale, and I cannot support it.

In my role as a citizen, I will be looking for opportunities to advocate for restructuring the mission of DGF to adopt a whole ecosystem frame of reference for wildlife management decisions.

Sincerely, Barbara Judy

To Whom it May Concern,

My horses has lived on the border of RCCLA land for several years and we have had no impact by cougars or bears. An increase in hunting kills and lengthening the hunting season would appear to be an arbitrary and unnecessary disturbance of the natural balance of this area (Amalia, New Mexico). As an example, when the coyote limits were not regulated we saw a significant increase in rabbits, rodents, and rattlesnakes on our land.

Thank you for your consideration.

With respect,

Martha R. Roberts

It is very hard to believe that you would even consider increasing the destruction of a living treasure such as our NM cougar population. Why? What possible benefit can there be beyond trying to appease some special interest group? Let Mother Nature determine the amount of cougars any area in the state can support. Don't we have enough of the state to our human population? No matter your politics on indigenous rights, it is hard to imagine any creature, human or otherwise, who is more "indigenous" to our state than the cougars. I hope someday to see one in the wild. Please do not reduce my chances by this proposed change. I would happily donate to a fund to reimburse any rancher who claims he lost a cow or any other such claim used as an excuse to kill these animals. Just like I hope I don't have to contribute to some activist lawyer group to fight you about it, but I will if necessary. Think about the future of our state and those who will come after us and do not kill any more cougars! While you are at it, why don't you stop killing them altogether? Do what is right, not what is expedient. Thank you.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I would like to voice my opposition to some of the the proposed changes to the cougar rules. Particularly the reduction of the quota in CMZ Q. While I'm an active outdoorsman and and spend many days a year coyote hunting, I find the study conducted to be flawed in its result. From my observations, I have observed 8 separate cougars in 2023 alone in Zone Q. While a coyote hunter is out and to see 8 lions in units 30 and 34 with only 98-134 lions in the area per the study, this seems far fetched. The populations appear to be much higher than the study shows based solely on practical observations.

I urge the commission to reject to lowering of the quote in CMZ Q.

An analysis from the *Wildlife Society Technical Review states*:

“State management programs for carnivores enable wildlife managers to pursue a variety of objectives in the public interest, including conservation, hunting opportunity, human safety, reducing predation on wild ungulates, and mitigating damage to private property, including livestock. Moreover, big game hunting opportunities generate revenue from the sale of hunting licenses and taxes on hunting equipment, which help finance law enforcement, habitat improvements, monitoring, and research. Together, public involvement, associated revenue, and professional management are key components of a process known as The North American Model of Wildlife Conservation” (Organ et al. 2012).

All of these factors are important in wildlife management efforts provided by the NMDGF. To examine that work, I met with Nickolas Forman, the [Carnivore and Small Mammal Program Manager for the New Mexico Department of Game and Fish](#) on October 11, 2023, to discuss questions raised by some of our members related to the state management of cougars. State management in different regions of the country often vary, with goals ranging from reduction, stabilization, or increase of independent cougars over time. Mr. Forman clarified that the established goal of the New Mexico state game commission is maintaining stable healthy populations of game statewide; this is therefore also the stated goal of the NMDGF staff.

A central factor contributing to determinations of numbers of tags for each game unit is the availability of adequate cougar habitat. Statewide, there are approximately 2 cougars per 100 km², but this is significantly variable depending on geographic elements and human populations. Population estimates are localized primarily based on the harvest matrices collected annually. Appropriate harvest rates may increase or decrease over time, given changes in harvests and characteristics of land and populations within regions and game units. The state also considers all of the considerations noted in the Organ quotation above, including shifts that local people may indicate as desirable, by reviews of harvest and other data across multiple years, changing human and geographic changes, issues of excessive predation, or lack of opportunities for involvement for residents and visitors. (In the case of cougars, there are nearly always available tags, so predation can often be handled by those affected, ranchers for example.)

GPS tracking collars, trail cameras, and advanced Spatial Mark-Resight models contribute to the available data used to determine harvest limits in ways consistent with current research. Additional critical data about populations within, across, and among game units including age, sex, and elements of health and parturition for harvested cougars are also provided by the conservation officers and other NMDGF staff. The NMDGF has recently initiated additional statistical analyses identifying more advanced bayesian inferences for constructing the best models for understanding data, adjusted for time. All of these data sources inform and support the new Integrated Population Model recently adopted by the NMDGF, potentially allowing data integration across up to 20 years, and will also be helpful in clarifying the impact of climate change over time.^[1] More research and collaborations with university programs would of course be useful, but the combination of methods and analyses currently used appears to be consistent with current science and provides considerable high quality information and breadth useful for game management.

Over the past five years, given the state's estimated total population of 3494 independent cougars, the number of tags available has averaged 620; the number harvested has averaged 338 (10% per annum of a population of 3494). The average annual number of female tags available has been 174; the average actual female harvest has been 88 (26% of the harvest but only 3% of the indicated 3494 total state population). Given these numbers, current harvests and the minor changes prop do not seem excessive.

I am writing to state my support of the Game & Fish Department's plan to increase cougar harvest rates. In the last few years, I have seen the deer herds (also elk, but mostly deer) plummet in several game management units. It is a known fact that one cougar will kill one deer PER WEEK. Increasing the number of cougars harvested will undoubtedly have an effect on the overall populations in the State of New Mexico. I know there are many so-called "environmentalists" and anti-hunters pushing to lower cougar harvest. I consider myself an environmentalist, as do most hunters. We care about the environment and the wildlife in this state and believe in utilizing science and following the recommendations of educated and trained biologists, who are in the best position to make this type of decisions! The last thing we need are knee-jerk reactions because someone thinks the cougars are cute little kittens. They are not. They are efficient killing machines and are doing a great deal of damage to our game herds.

Thank you for the opportunity to comment. I hope you will do the right thing.

Please consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.

- Given the uncertainty of habitat and population estimates of both bears and cougars, the **quotas for both should be reduced**, not raised. Kill quotas for both species have been unjustifiably high for many years.
- Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.
- Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.

I can not agree to stopping or drastically limiting Cougar and Bear hunting in New Mexico.

The rural population of our state depends on the production of domesticated farm animals. Cattle, Sheep and Horses and others. They are the back bone of the nonurban population of our state.

These family businesses are also the stewards of our private lands. The loss of livestock due to predation is very financially burdensome. Additionally without the funds they derive from allowing hunting on their lands their very existence would be in jeopardy.

Please put your common sense on and think this thought without being influenced by the overly emotional pleadings of a very minor segment of people, most of whom are not even residents of our state.

Hello,

I support a science-based wildlife management strategy. Not a strategy based on city dwellers' emotional attachment to charismatic megafauna.

I just returned from hunting for elk in 6A outside Cuba, NM, and AFTER the unit closed to hunting saw 3 bears. It's obvious to me that sufficient resources exist to support a viable population.

Some people want to scream and huff about predator hunting when they have zero experience with it. They rely on emotions and feelings instead of sound science and a realistic understanding of effective ways to manage predators.

The real agenda is to get rid of hunting; period. The approach is to incrementally erode hunters' opportunities until we no longer get to experience the outdoors and engage in an activity tied to our human origins.

Please allow the responsible hunting of bears and cougars by hunters and hounds.

Hi NM Game and Fish

As a NM citizen who has held an NM fish and game license for most of my life, I wanted to urge you not to increase the hunting limit for bears and cougars. There are many reasons for maintaining strict and low bag limits on these predators. First, they fill an essential niche in the NM ecosystem, and increasing the number taken by hunters would limit their role as cullers of deer and other species. Second, these creatures have been under great stress by global warming and changes in habitat wrought by expansion of humans into what used to be their homes. Third, the chance to encounter both of these majestic creatures is a joy I have had on many occasions hiking around mountains in our beautiful state. Those opportunities are a draw for tourists, who bring relatively low carbon income into our state.

Thank you for your consideration.

Please vote in favor of continued hunting of predators including the cougars and bears. The state of Washington adopted a program to stop hunting cougars and bears. Within a few short years, the cats had lost all fear of man. Cougars attacked runners and hikers. I do not want to see people needlessly maimed and crippled.

Thank you for your support of hunting.

Have a great day!

Jan

Just because we humans are at the top of the food chain, doesn't mean we are gods. Hunting these beautiful animals is unconscionable. Nature takes care of a species if there are too many...we do not need to cull the predators.

These are my thoughts...for whatever they are worth.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Hound hunting for bears and mountain lions in New Mexico is crucial for population management and the overall well-being of the state. By carefully regulating these populations, we can maintain a healthy balance in the ecosystem. Banning hound hunting could lead to overpopulation, which can have detrimental effects on both wildlife and the state of New Mexico.

Hound hunting allows for selective harvesting, targeting specific bears and mountain lions that may pose a threat to human safety or livestock. This helps prevent conflicts and ensures the safety of communities. Additionally, hound hunting provides valuable data for wildlife management, allowing researchers to gather information about population size, health, and behavior. This data is essential for making informed decisions and implementing effective conservation strategies.

If hound hunting were banned, the bear and mountain lion populations could increase unchecked, leading to overpopulation. This would result in a strain on their natural food sources and potential damage to the ecosystem. Overpopulation can also increase the risk of human-wildlife conflicts, as bears and mountain lions may encroach on human settlements in search of food. This could impact the safety and well-being of both residents and animals.

In summary, hound hunting plays a crucial role in population management for bears and mountain lions in New Mexico. It helps maintain a balanced ecosystem, prevents conflicts, and provides valuable data for conservation efforts. Banning hound hunting could lead to overpopulation and negative consequences for both wildlife and the state. Responsible and regulated hunting practices are necessary to ensure the long-term sustainability of these populations and the overall health of New Mexico's natural environment.

Yours in sport

In the shortest term I can express DO NOT increase permits for cougars. You should not put these animals at risk because some rich person from out of state wants a rug or mount in his home. You already do this with our deer and elk populations. The NM Game And Fish is funded by licence sales in large part when does this stop? The folks that have the most to gain are ranchers and guides. In the bootheel we have the Diamond A ranch they proclaim themselves a nature conservancy yet they make many thousands from these permits. This is not right don't do it.

New Mexico Game and Fish Council,

I am writing to express my support for opening the harvest numbers for both Cougar and Bear, here in the state of New Mexico, especially Cougar.

In spending time in the forest, I see Cougar (*Puma concolor*) sign far more readily than in the past 18 years. This apex predator needs to be managed from a Scientific/Biological basis, not an emotional one. While I do not own hounds, I understand how hounds are the best and most humane way to harvest this elusive predator. Most importantly, hound hunting allows select age harvest, and the select harvest of excess Male cats, with a side bonus of training a predator to be wary of humans.

I support Mr. Winslow (I hope all of you do too) in his years-long study of the Black Bear (*Ursus americanus*) population, showing that this population too, is larger than previously believed. Empirical data should be the basis of harvest--not anthropomorphised emotion. And I would encourage the Council of G&F to open, select spring bear hunts. If done properly and at the appropriate time, these spring hunts could be a great management tool for slowing down elk calf and mule deer fawn mortality.

Sincerely and with regard,

Nathen Thomas

To whom it may concern,

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The states predator population is already a problem and was even before the trapping ban.

The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example.

One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Kind regards,
Clay Sheen

To the Commission:

Congratulations to our great state of New Mexico to make the time and effort to protect and understand our wildlife populations. My husband and I live in Gila Hot Springs, New Mexico where we witness the effects and practice of the open season hunting on bears and cougars.

Now that this Wilderness area is no longer designated for livestock and respect for the native predators and their important place in the ecosystem is understood, it is certainly a welcome and important time to better understand how to protect these animals.

The positive of hunting seems to be as humans we rarely see bears and cougars. They are wary of humans and don't come to camp or to our homes as they do in places like California. But the rise in senseless game trophy hunting has increased. Hunters are less skilled and wounded animals and killing of female bears has given rise to orphaned bears. They do come starving near camp and our ranch. Hunters with poor marksmanship skills wound and don't differentiate the sex and age of their prey.

Hunters get a thrill from hunting with their dogs, and in moderation there is much skill in this partnership. Yet the advantage they maintain is overwhelming. I have witnessed one local report 10 lions in a season. The claim is cougars are decimating the elk population. There is not a clear understanding of this idea and seems more a convenient excuse to allow uncontrolled hunting than an understood fact.

We no longer live in a society that is at the mercy of large game like bear and cougars. Humans now are responsible for their protection to maintain healthy populations. Hunters always are a loud voice at the table in these discussions, but I think they maintain a denial to hearing the complex truth of their role in reducing these animals to the point of extinction.

The last Gila grizzly was killed near our ranch some decades ago. Once shot and never again seen in these parts, then there came nostalgia and regret. We are now in a position to use technology, biologists and good planning to ensure we are not heading to a point in time of the last bear and cougar in the Gila.

I hope for the best outcome for these voiceless members of our wilderness in the outcome of this discussion.

Thank you for your time and your forward thinking efforts today.

Sincerely,

Betsy & Sam Holdsworth

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Sir,

To whom it concerns:

Please change the policies of the NM Department of Game and Fish and protect cougar and Black bear populations in your state.

Given the uncertainty of habitat and population estimates of both cougars and bears, the quotas for both should be reduced, NOT raised.

Second, both animals are now known to be extremely important to the integrity of our ecosystems, and each species can self-regulate their own numbers.

Furthermore, New Mexico has recently experienced severe drought, extreme heat, and wildfires, all of which will almost certainly continue and intensify into the coming years making survival very difficult.

Our climate trends weigh in favor of lowering kill quotas, not raising them!

If we want to continue to see cougars and bears roam our mountains and canyons then it is imperative to protect cougars and bears, instead of hunting, trapping, wounding and killing them.

Sincerely:

Anna Brewer,

Good afternoon,

I am writing in regards to rule changes for cougars and bears. In unit 2, the four corners area and many other areas of the state we are seeing a sharp increase in lion activity and growth. Just a few weeks ago a lion was trapped and relocated in Rio Rancho. I'm asking that the board bring back lion trapping on private land to manage the population and be able to fill the quota. With changing weather cycles and less moisture lion and bear encounters are increasing in urban areas, houndsman are unable to run dogs and be successful. Bear management and rules should stay the same. Thank you for your time.

Game and Fish has a difficult job, and I appreciate all that you do. However, I oppose extending hunting limits on cougars in New Mexico which was the subject of Richard Brown's *My View* column in the Friday, October 6th 2023 *Santa Fe New Mexican*. I've lived in Illinois, New York, Virginia, Georgia, and now New Mexico which unlike them is one of the few unspoiled places left in America. People visit, vacation, and in my case choose to live here because of that. It is not sport to use high tech gear to shoot a cougar out of a tree as is usually the outcome. Not as bad as coyote killing contests resulting in mounds of rotting animals or seeing who can shoot the most prairie dogs in an afternoon I suppose. Still not good. My father's rule was don't hunt it or fish it unless you plan to eat it. That makes sense. Killing an incredible animal like a mountain lion for bragging rights does not. Yes, go into the mountains, do the hard work of looking for sign and tracking, find your quarry, but take its picture not its life.

Subject: [EXTERNAL] DEFEND SCIENCE-BASED BEAR & COUGAR MANAGEMENT
Date: Friday, August 18, 2023 11:56:34 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico State Game Commission,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

We respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,

Nick Kufalk

Date: Saturday, August 5, 2023 1:10:57 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I disagree with the proposed NM Game & Fish authorization of increasing hunting limits allowing the killing of more of New Mexico's bear & cougars.

This is an unconscionable decision to promote hunting of these two species when:

- * there is lack of actual population data of black bears & cougars in New Mexico

- * both species self regulate population growth of bear & cougar secondary to food, water, & habitat

- * former is naturally intensified by the drought conditions with in our & bordering states

- * NM Game & Fish is to work for, conserve, and respect the wildlife of NM, not foster the inappropriate recreational hunting of these species for monetary gain

As a New Mexican who has lived here since the 1960's I have witnessed the dwindling of the wildlife in our state. I strongly encourage NM Game & Fish to be honorable, fulfill the mission it was established for, "To conserve, regulate, propagate and protect the wildlife and fish within the state of New Mexico..." & work with groups such as Animal Protection New Mexico, Sandia Mountain Bear Watch, etc. to address the needs of these bears and cougars [and other species] as they struggle to co-habitate in NM with ever encroaching humans.

Sincerely,

Toni Wood

I specifically dislike Zone closures happening before the actual female quota is reached. Multiple years I have had to switch areas due to closures, that the female quota was close within 10+ Sows left on the quota yet the Zone gets closed anyway.

For Cougar, most of us never see them without the aid of dogs. I think not enough of these apex predators are removed and the elk, deer, and the rest end up paying for it.

I really don't see the harm in baiting these animals if there are quotas in place to regulate the amount that are taken. Or why did we just ban trapping from public land? Trappers could solve a lot of issues if regulated properly. I believe that is why the federal government has had trappers employed for a long time.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I disagree with your proposed extension of hunting limits for cougars. Also there should be guidelines as to how to actual hunt these animals. The lack of regulations about trophy slaughter is akin to shooting fish in a barrel. I don't believe that it is ethical to tree a mountain lion with sophisticated gadgets, dogs, etc. until the "hunter" arrives and shoots the defenseless animal. This is not sport. This is slaughter. If ranchers complain about the loss of their herd, they should check with African 3rd World Countries that have solved that problem to everyone's satisfaction. The cougars were here first and humans are impinging in their territory.

Please consider more humane and ethical solutions to this situation.

New Mexico Department of Game and Fish,

As a resident of New Mexico, I understand the importance of Hound Hunting Lions and Bears in New Mexico. It is vital in helping to control populations, including going to the limit on female sub-limit. Hound Hunting provides an opportunity to harvest meat from both lions and bears, with a continued opportunity to purchase tags for the animals. The system that New Mexico has established to keep these things in place has been working wonderfully. We don't need Elk and Deer tags to go towards harvesting Lions and Bears, they need to be purchased separately.

Thank you so much for all you do,

Dear Commissioners,

New Mexico state law that spells out the state's bedrock policy of wildlife management. The law calls for providing "an adequate and flexible system for the protection of the game and fish of New Mexico and for their use and development for public recreation and food supply, and to provide for their propagation, planting, protection, regulation and conservation to the extent necessary to provide and maintain an adequate supply of game and fish within the state of New Mexico." It is not only necessary and appropriate for NMDG&F to use scientific based management strategies including hunting to manage predator populations, but it is also the law.

Sincerely,
Justin Miles

Subject: [EXTERNAL] Do NOT increase the quotas - Reject the bear and cougar rule to protect New Mexican wildlife
Date: Monday, August 14, 2023 11:26:17 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Department of Game & Fish,

I vehemently oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Extending hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars. No. Just NO.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety. I'm a hiker. I hear gun shots outside of hunting season. If you're going to do something, start enforcing the rules.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) REDUCING the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you. I appreciate the work you do. But we can't hunt these creatures any harder. Their habitats and food sources are becoming more and more limited. We lost a historic amount of land to fires last year. The populations need time to rebound. Increasing quotas - especially now - is not acceptable.

Sincerely,
Pamella Neely

Subject: [EXTERNAL] Do not abolish hound hunting..
Date: Thursday, August 17, 2023 11:55:51 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The states predator population is already a problem and was even before the trapping ban.

The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences.

California is the perfect example.

One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise

[Sent from Yahoo Mail on Android](#)

From: [Gideon McClure](#)
To: [DGF-Bear-Cougar-Rules](#)
Subject: [EXTERNAL] Do not increase hunting quotas for bears or cougars!
Date: Saturday, July 15, 2023 6:24:31 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

1) Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.

2) Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures.

3) Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.

Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless and cruel.

4) The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.

5) NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.

6) Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited. Moreover, given the newness of these studies, they are only a snapshot of the current population in each area. We do not yet have long-term on-the-ground field studies of bear and cougar populations throughout the state that could indicate population trends. Absent good data, the department should be exercising great caution with managing the population of bears and cougars.

Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the public also show opposition to killing bears and cougars using these methods for 'trophies and recreation. Ask NM Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.

Respectfully,

Gideon McClure

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear DGF,

As a New Mexico taxpayer, citizen and voter I strongly oppose the idea of extending the hunting season and raising kill quotas for bears and cougars.

These populations self-regulate and are already stressed by human encroachment into the urban wildland interface.

A recent report from the Weizman Institute titled ["The Global Biomass of Wild Mammals"](#) published in the Proceedings of the National Academy of Science, researchers found that beef cattle and other livestock cultivated for meat and dairy outweigh the sum total of all non-domestic mammals (including not just bears and cougars but whales, elephants, wildebeest, etc.) by a factor of thirty-fold.

Clearly, nature's scales are out of balance. We have an oversupply of people, not an excessive number of wild animals.

Thank you for voting to reduce hunting limits of these creatures.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

It is imperative that wildlife management for Big Game, Small Game, Non-Game species be managed on scientific principles and not raw emotion as espoused by typical big city urbanites that are in love with the notion of wilderness and the balance of nature but yet know little to nothing about any of these issues, much less actually getting out and doing something to improve the environment. I have never seen them on a Big Horn Sheep Water Hole project, a fence modification for Pronghorn Antelope or an erosion project to protect a trout streams, and so on, but yet they profess to know what is needed and when. These are the same people that want to build solar & wind farms on winter range for mule deer and fawning habitat for antelope. Typically the only thing that is amazing about these folks is how dumb they really are and I strongly urge you to not let them destroy the North American Model that has worked so well in all 50 states in the last 100 years.

Please keep Bear & Lion management based on biological data and not emotions. Your time and consideration in this matter is greatly appreciated!

Sincerely,
Brian George

Subject: [EXTERNAL] Echoing the Need for Hound Hunting in Predator Control
Date: Wednesday, August 23, 2023 1:14:10 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

Let's keep the bear and cat hunts. As the world changes, so do perspectives on hunting. New Mexico has a chance to set a precedent by ensuring that hunting practices are not only sustainable but also ethically sound. Proposals, such as making it mandatory for hunters to retrieve edible portions from their game, can deter criticisms and emphasize responsible hunting. It's not merely about preserving New Mexico's hunting traditions, but also about evolving them for the better.

Sincerely,
Braden Tethal

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

Wildlife resources are an invaluable asset for us all. Grounding wildlife management in the North American Model and the Public Trust Doctrine ensures sustainability. Bear and cougar hunting, when executed responsibly, is an important tool. Let's remain committed to evidence-based approaches and prioritize long-term sustainability. I support bear and cougar hunting, with personal knowledge of what happened in California after one was banned and the other restricted. Bear-Human conflicts are exploding in California, and there have been more deaths and attacks by cougars in the last 20 years than the 100 before that. Managing wildlife is critical to health populations, let the biologist do their job.

Sincerely,
Robert Deitz

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

I am writing as a former resident of New Mexico and an avid hunter. I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The state's predator population is already a problem and was even before the trapping ban. The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example. One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Sincerely,
Bruce Williams

Subject: [EXTERNAL] End mountain lion hunting
Date: Wednesday, August 23, 2023 3:59:25 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Mountain lions are not bears. Mountain lions should not be lumped in with bears in a "bear-cougar" rule for several reasons.

- While some advances have been made in counting bears, it is difficult, if not impossible, to come up with a reliable mountain lion count. The Game Department has no idea how many mountain lions are in New Mexico and where they live.
- Some people eat bear meat (although no one depends on bear meat to feed their families), but no one eats mountain lion meat.
- Other states protect mountain lions, notably California where they are viewed as celebrities.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

Bear and cougar hunting has my support. It's essential to recognize the broader implications of abolishing hound hunting. The effects are evident in states like California. Our ranchers, who are deeply connected to the land, rely on such methods to maintain balance. I urge the commission to consider these broader ecosystems when making decisions.

Sincerely,
Conrad Baker

Dear Commissioners,

Each year, thousands of hunters contribute both economically and ecologically to our state's wellbeing. Their contributions extend far beyond mere sport; they play a pivotal role in habitat restoration, wildlife population management, and conservation education. It's essential that we acknowledge and support their role in our ecosystem. I applaud the efforts to continue cougar and bear hunts.

Sincerely,
Heinz Kalkhoff

Dear Commissioners,

I commend the New Mexico Department of Game and Fish biologists for their work on the bear and cougar rule. I support their proposed changes. The proposed changes in many instances reflect the success of game department management practices and resulting increased populations.

Thank you again for the opportunity to comment on this rule. I appreciate this commission's commitment to securing the future of hunting and conservation in New Mexico.

Sincerely,
Jeff Beasley

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

Even if you don't live in New Mexico, YOUR VOICE NEEDS TO BE HEARD. When hounds are used for hunting they are an integral tool, which allows us to bay an animal, assess and even release it without a fatal shot. Hound hunting of bears in Colorado was removed via ballot initiative, and now the bruin populations have skyrocketed; Residents have been bitten, scratched and attacked. Don't let anti-hunters remove this management tool from New Mexico too!

Watching the fallout from the trapping ban has been a sobering experience. It underscores the dangers of compromising with groups that often seem to have a narrow focus. I hope we can stand firm against such pressures and maintain a holistic view of our state's ecosystem needs. Support the cougar and bear hunts!

Sincerely,
Mia Anstine

Dear Commissioners,

Keep the bear and cat hunts! It's essential to appreciate that every region has its unique ecological challenges and solutions. Drawing parallels with other states without understanding the underlying dynamics can be misleading. For instance, the consequences faced by states that banned certain hunting practices should serve as valuable lessons. Collaboration and understanding between various stakeholders can lead to informed decisions that are beneficial in the long run.

Sincerely,
Gerald Hunter

Dear Commissioners,

I woke to a bear in my house last Friday, he had been going from door to door trying to break into my neighbors before he got to me. We have been given rubber bullets and CPW is issuing an add a bear tag to elk and deer tags in high conflict areas to reduce population but even with all this were unable to establish proper management after losing hound hunting and spring bear hunting with bait. The population has skyrocketed and we're seeing more "problem Bears" increased encounters in neighborhoods and campgrounds. This is a management problem. Not a problem bear problem. Observing the repercussions of hound bans in places like Colorado has been alarming. Predator populations must be managed responsibly for the health of the ecosystem. Let's learn from others' mistakes and maintain the balance here in New Mexico. Continue with cougar/bear hunting!

Sincerely,
John Pezzin

Subject: [EXTERNAL] Extended trophy hunting time for cougars
Date: Friday, October 6, 2023 9:35:23 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I oppose the extension of time for the hunting of cougars. Trophy hunting is immoral in its nature but is popular among some groups.

The least we can do is minimize the impact on the environment and the species by limiting the amount of time allocated to such practices.

Cougars are an integral part of the natural landscape and as such have an impact on the entire ecosystem.

Please do not extend the time allocated for trophy hunting.

Thank you

The issue is Conservation and Wildlife. Please read before Aug.10, 2023. Thank You! To: New Mexico Department of Game and Fish @ DGF-BearCougar-Rules@state.nm.us August 4, 2023. Dear New Mexico Department of Game and Fish, As usual, it is disappointing that the New Mexico Department of Game and Fish proposes yet another plan to indiscriminately raise hunting quotas for the overwrought wildlife of our state. This time the targeted species are Bear and Cougar. All of our public wildlife populations are in extreme peril from climate change, drought, and loss of habitat. You have not done your due diligence of statewide ongoing scientific peer-reviewed counts of either species in years. And with our rapidly changing natural environs this is what is called for- not a last ditch ruling to trophy hunt the last populations of Bear and Cougar possibly to extirpation! NMDG&F's mission statement includes "to conserve". Your suggested increased quotas are more evidence that another agency needs to be formed that is dedicated to conservation oversight for all hunting rules and management of all of our wildlife. Trophy hunting needs to end now! Killing Bear and Cougar is in violation of "wanton waste laws" of hunting. And many hunters object to the low ethics of hound chases and resulting treed kills of our bear and cougar! There is also a growing non-consumptive public that finds these practices abhorrent. Hunting has been in steep decline over the last twenty years while wildlife viewing has dramatically increased. "More than 35.8 million Americans went fishing in 2016, while 11.5 million hunted and 86 million watched wildlife. This means that 14 percent of Americans 16 years of age or older fished, 4 percent hunted and 34 percent participated in wildlife watching" (U.S. Fish and Wildlife Service 2016- 50 State Survey). Shouldn't your policies reflect public values and

practices? Even if hunters' bullets may pay for many NMDG&F salaries and management costs, the wildlife is nonetheless owned by every citizen in the state, not just hunters. We realize that true conservation is not the business you are in, but it is statistically significant that our citizens are mostly wildlife watchers by a margin of almost 2:1. It has also come to our attention that non-hunting human-caused kills for bear and cougar are not being included in quota counts. For instance, depredation of cougar to boost big horn sheep populations, and/or accidental road-kills. All bear and cougar mortalities should be counted towards the quotas. On a personal note, I was a mountain hiker. I used to encounter bears regularly on my hikes. But spotting bear in NM has steadily declined over the last fifty years. I realize this is anecdotal and not scientific reporting, but it has been my observation. I hope future generations of New Mexicans will have the opportunity to thrill at seeing wild bears and cougars on our beautiful wild lands. Let's conserve our wildlife with the best science available, with biodiversity as the model, and with great respect and restraint. We request that this letter be entered into the official record of Public Comments for Bear and Cougar Rules proposal 2023. Thank you for your time and attention. Respectfully, Jan Cohen, M.Ed., Wildlife Chair, Indivisible SOS, NM email: hh1joylane@yahoo.com cc. Date: Saturday, August 12, 2023 10:54:51 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I understand G&F killed a bear who was getting into someone's chicken pen out here in the East Mountains. Instead of killing the bear, why didn't you advise the people to get an electric fence around their pen?

They call it a nuisance bear. Well, we have nuisance people. They're shoplifting, car jacking, drug dealing, etc., etc. Does anyone suggest they be shot?

Shame on G&F for dealing with our wildlife by just taking the easy way out. That bear didn't need to be shot.

Subject: Precious Wildlife

Hello --

I understand you're taking comments about the planned bear and cougar killings.

Charles Fox of Santa Fe wrote an opinion piece in Sunday's Albuquerque Journal. He made some good points, such as ... it's not necessary and it's cruel to chase them down just to give hunters a thrill.

I don't see how anyone can kill a cougar. They're beautiful animals. I don't

understand how anyone could just shoot one or why they think they have a moral right to do so. Also, we've had a mama bear and 2 cubs in our yards out here in the East Mountains this summer. We all care about them. I don't understand destroying life so wantonly.

My comment is, please just leave our wildlife alone.

Judy Crane

Dear Committee,

In my previous email I expressed my general support for managing predators such as black bears and mountain lions via hunting based on scientifically identified quotas. In this email, I'd like to provide my support for recently proposed changes (described in attached document) which, among other modifications, increase harvest limits for both boar and sow in BMZs #1 and #10.

These are very good changes which reflect increase of black bear populations in this areas. This adjustment not only provides more opportunities for hunters who peruse black bears (including myself), but also minimize loss in livestock, and protect populations of ungulates which are affected by bears especially in a fawning and calving seasons.

Sincerely,
Piotr

Subject: Letter in Support of Predator Management via Hunting

Dear Committee,

My name is Dr. Filipczak, and I am an assistant professor of chemistry at the UNM-Valencia Campus.

I am writing this email to express my deepest support for managing predators such as black bears or mountain lions via regulate hunting.

North American model of wildlife conservation is the most effective method of managing wild game which has been proven for more than a hundred years. Absolutely integral part of it is regulating numbers of predators by harvesting part of

their population by hunters based on the quota established by wildlife biologist from the Game and Fish Department. From the ethical stand point, harvesting a black bear or a mountain lion is not at all different from harvesting an elk or a deer. From the ecological perspective, it is an absolute necessity as the populations of these species are on a big rise, and available habitat cannot accommodate further growth. Lastly, it is an extremely important part of a beautiful New Mexican culture which is still vivid for many residents, especially these from rural area.

There are examples of states (e.g. Washington state) who replaced traditional predator hunting seasons with state agency-managed shoot-out, and failed dramatically. Personally, I find hunting tradition which feeds on northern American model of wildlife conservation as one of the most attractive aspects of living in the State of Enchantment. It also unites many residents of this wonderful state regardless of their political affiliation. Any action that would result with replacing this tradition- and science-based model would be against vital and long-term interest of wildlife, wild habitat and all residents who love interacting with them.

If there is anything else that I can do to better support my statement, please do not hesitate to reach out to me.

Sincerely,
Piotr

I live along Rio de la Plata which serves as a dispersal corridor for black bears, mountain lions, bobcats, deer and other wildlife. I enjoy seeing the wild animals even though a bobcat decimated my poultry and one morning a blonde black bear was on top of my chicken coop. When someone murders one of these fine wild animals I am deprived of the opportunity of observing and enjoying these animals alive and thriving in their natural habitat and the ecosystem these animals operate in are deprived of the services each individual provides. So stop the killing! New Mexico has *Cannabis* revenue now. We do not need the revenue from selling killing licenses! So just stop it. Stop the killing. Stop pandering to the psychosexual perversions of those who enjoy inflicting fear, pain and death on innocent, defenseless animals. These people are serial killers and it is only fear of consequences that keep them from practicing their sadistic arts on humans instead of non-human animals. I count on you, as the public servant of the Taxpayers, to do the right thing. Thank you.

Dear New Mexico Game Commission,

I am an Albuquerque resident and an avid hunter. I fully support the proposed changes to the bear and cougar regulations as well as all science-based management practices/rules. As a scientist as well as a hunter it is very important to follow the facts not emotions when it comes to rules and regulations for hunting and fishing throughout our state.

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people (that us and myself!), to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and I strongly support legal bear and cougar hunting as an appropriate management tool.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

I request that the State Game Commission prioritize the opinions of our biologists and scientist and the recommendations developed from their science-based data. Without data and science-based recommendations emotions can cause more harm than intended.

Please follow the experts to make hunting and fishing viable for all New Mexicans for decades to come.

Thank you,

John van der Laan

I am FOR hunting bear and lions with hounds. Hound hunting plays a crucial role in population management for bears and mountain lions in New Mexico. It helps maintain a balanced ecosystem. Banning hound hunting could lead to overpopulation and negative consequences for both wildlife and the state. Responsible and regulated hunting practices are necessary to ensure the long-term sustainability of these populations and the overall health of New Mexico's natural environment.

Dear Commissioners,

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The state's predator population is already a problem and was even before the trapping ban. The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example. One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Sincerely,
Douglas Reimer

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Specific comments on the bear and cougar rule: if we do not have hunting then these predatory animals, and they are predators at the top of their respective food chains will destroy the deer populations, the elk populations and then the easier to hunt and kill domesticated herds-sheep and cattle. Along the way they will breed, increase in numbers and become a direct threat to humans:case in point-Connecticut and New Jersey. Limited hunting will increase the finances of the State and the guide services used for these hunts. The major question is how the hunts are to be carried out. Will baiting be allowed.?? Will dogs be allowed both for bears and cougars.? Do we have an accurate assessment of the populations to be hunted??? Initially, if approved,the hunts should be by draw both for in state and out of state hunters for 3 to 5 years to get an idea of the popularity, the harvest and the best regions for the hunts, and the effects of the hunts upon the population hunted. We need to intelligently MANAGE this resource so it survives in nature as it is important in natural deer and elk population control. We also need to MANAGE these predators to allow their survival. We are all linked in nature!!!

From: Gerry & Jean <engelhill@comcast.net>

To: DGF-Bear-Cougar-Rules@state.nm.us

Dear New Mexico State Game Commission,

I am a fair chase bear hunter and would like to continue to be able to do that. Fish and wildlife resources are the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. Science based management has resulted in good sustainable populations of bear and cougar in New Mexico. This management has included reasonable harvest of these animals. I support legal bear and cougar hunting as an appropriate management tool. I believe you should continue stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

I respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures. I WOULD HOWEVER LIKE TO SEE THE SEASON CONTINUE TO START IN SEPTEMBER RATHER THAN IT BEING MOVED BACK TO AUGUST.

Respectfully,

Gerry Engel

Subject: Mountain Lions

PLEASE Leave the Mt. Lion count alone. New Mex. has already killed off enough lions. Between the natural death and rich hunters coming in there have been enough to already make the count too low.

Next thing you know they will have to be placed on the extinct list.

LEAVE THE MOUNTAIN LIONS ALONE. DO NOT INCREASE THE NUMBERS TOO BE KILLED.

Thank You, Jane Harrison

PS I moved here because of the wild animal life,

Subject: Let The People Hunt.

I'm not even a lion hunter, but we need balance and lion hunting is needed. Have you ever tried to hunt deer where it's covered with mountain lion tracks? You won't find a deer within miles. I have found deer dead heads in such places tho. The lion hunters help the big game hunters which provides more big game tags and food on our New Mexicans Tables.

From: [Michelle Franks](#)
To: [DGF-Bear-Cougar-Rules](#)
Subject: [EXTERNAL] Game Commission: I oppose the proposed trophy hunting rules for bears and cougars
Date: Friday, August 11, 2023 1:40:56 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I oppose the subject proposal because:

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.

Killing bears and cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.

Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless and cruel.

The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.

NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.

Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited. Moreover, given the newness of these studies, they are only a snapshot of the current population in a given area. We do not yet have long-term on-the-

ground field studies of bear and cougar populations throughout the state that could indicate population trends. Absent good data, the department should be exercising great caution with managing the population of bears and cougars.

Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for 'trophy' and recreation. Ask NM Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.

Respectfully,

Michelle Newsom

Dear Commissioners,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

We respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Sincerely,

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I fully support the scientific management proposal submitted by game department biologists and the continuation of scientific predator management programs in our state.

Here in Colorado in the recent years they have outlawed and banned all forms of bear hunting except for general stalking tactics. Unfortunately, now our bear population is out of control. bears are being killed regularly by Colorado Parks and recreation. Colorado parks and recreation officers do not take pride nor are they pleased in the fact that they are forced to kill these "problem bears" simply because now the bears are on porches, killing people's dogs, breaking into people's homes, etc etc.....

One of the most disappointing facts about our current situation here in Colorado is that the bears that could be responsibly harvested by responsible outdoorsman and sportsman, are being forcefully euthanized because these bears are now causing problems for the folks that voted against our conservative hunting regulations and methods here in Colorado. They are targeting our cat hunting now as well and the anti-hunting folks that vote on these measures, I don't believe they understand the long-term effects it has on the predator populations. In my opinion it's absolutely egregious!

In closing, I would like to take a moment to reiterate my full 100% support of the game commissions proposal for continued hunting of bear and cats in New Mexico .
Thank you.

Respectfully,
Mick Babcock

Attn: New Mexico Game and Fish

Hasn't this year been tough enough? You are in the midst of a 20 year drought, and experiencing record heat. Give wildlife a break! Your plan of increasing the number of bears that can be killed and maintaining cougar hunting quotas that were already excessive according to experts is horrifying. Why is it that humans don't understand that Nature's plan is perfect. Why is it that you want to "manage" bears and cougars with sketchy counts and listening only to input from the minority. I've read that 99% of NM citizens don't hunt bears or cougars, yet you say you need to "maintain sustainable cougar and bear populations and hunting opportunities". This means you plan to cater to the minority regardless of what the majority wants! NMDGF and your Game Commission should be obligated to follow science. This decision is based on questionable science. Shouldn't the Game Commission as trustees of the wildlife trust wait for credible information in order to make such a bold and likely unsustainable decision? It is obvious your "management" of wildlife is aimed towards hunters and hunting opportunities. Respect nature and listen to science! Please consider kill quotas be seriously reduced to protect our wildlife. Raising quotas when your numbers are only estimates and likely inaccurate puts these species at risk! Nature knows how to manage, and these species are excellent at self-regulation.

Sincerely,

Candace Funk

Subject: [EXTERNAL] Have your scientific studies of bear and cougar populations been peer reviewed by impartial experts?
Date: Wednesday, August 9, 2023 6:13:48 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Game and Fish Dept.

RE: Comments on new bear and cougar limits

I read the editorial in the Santa Fe New Mexican written by Nina Eydelman and Mary Katherine Ray that harshly criticized your proposed rule on harvesting bear and cougar. But their article did not offer any substantive reason for pushing back other than accepting their opinion that you have gotten it wrong. So my question is did you have your studies peer reviewed by outside wildlife management experts who can independently and impartially validate or criticize your methodology? If so, what was the result?

The authors, Nina Eydelman and Mary Katherine Ray, make comments about climate change, but I would assume that climate impacts the number of bear and cougar that the state can support if climate change affects their food sources. Have you considered that?

I'm not a wildlife biologist, so I am not in a position to decide whether the new rule is a good one or as Nina Eydelman and Mary Katherine Ray say, a bad one. Personally, I am not fond of shooting animals just for the sake of killing them. I hunted deer for many years to fill the freezer. Hunting is good if it is properly managed.

I would like to hear whether you asked for and received external validation for your proposal and the details of peer review, if it was done. If it was not done, why not?

Thank you, and best wishes,

Khal Spencer, Ph.D. (geochemistry, analytical chemistry)

Date: Thursday, August 17, 2023 7:43:09 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I have lived in NM most of my life and recall buying deer, bear, turkey licenses for \$7.50. I have had access to state, federal and private lands and seen some of our state's most pristine backcountry while hunting. I am apposed to any efforts curtailing access to hunting any species that has historically been allowed. A very small percentage of hunters actually hunt bear and lion. Most hunt deer, turkey and upland game. Be sure and have the game department provide the statistics on this before you make a decision to stop it.

Sincerely,

Phillip Butz

Dear Commissioners,

The core of New Mexico's wildlife policies has always been twofold: conservation and responsible utilization. With the emphasis on science-based strategies and responsible hunting, New Mexico stands as a model for how wildlife should be approached and respected. Cougar and bear hunting must remain in place.

Sincerely,
Nathan Garvin

Dear Sir or Madam,

I am an out of state hunter that hunted in New Mexico in 2020 and 2021.

I support science-based decisions in regards to wildlife management. Please strongly consider the opinions and findings of your wildlife biologists when making decisions on wildlife management. I am a strong supporter of our rights to responsibly pursue and harvest game species, especially through the use of our hunting dogs.

To whom it May Concern,

If it is the philosophy of “fair chase” that we’re discussing, I would make the argument that hound hunting is the greatest of all “fair chase” methods. It’s the ONLY method, where the game being pursued, is fully aware, from beginning to end that it is being hunted.

We’re not talking about a buck, mindlessly chasing a doe to breed, half out of his head with instinctual lust. We’re not talking about an elk being dropped from 500 yards away with a bullet he has no sense of where it’s coming from. We’re not talking about a boar being ambushed from above, entirely unaware of his enemy.

Once a game animal hears a hound, they are fully aware. All of their senses come into play. The terrain is their home, and they hold all the cards. More often than not, they use these advantages to escape.

Hound hunting is the only method of hunting where once an animal is “caught”, its age, sex, and health can be determined. If it’s too young, or the wrong sex, it can be set loose, to continue with its life. No other method of hunting has this conservation aspect, where caught game can be given another chance, if they were not the intended target.

Thank you for your time.

To whom it may concern,

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The states predator population is already a problem and was even before the trapping ban.

The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences.

California is the perfect example.

One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Best Regards,

Clayton Jump

Subject: [EXTERNAL] Hound Hunting: New Mexico already employs year-round contractors to kill lions
Date: Tuesday, August 22, 2023 5:04:15 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

New Mexico is killing lions year-round by private paid contractors in several hunt zones already. A density study was conducted in the area around Santa Fe, the first of its kind in 2017, and found NMGF had so over estimated the lion population that they had to half their quota.

Before NM agrees to this new hunt quota, their Game and Fish needs to do real density studies in all the hunt zones. NMGF estimated densities that were borrowed from other states, some of which had habitat entirely different than what was in New Mexico. In addition, hired year-round cougar killers so to keep bighorn sheep is not based on science. If NMGF were serious about preserving lions, and bighorns, they'd be collaring every lion in bighorn areas and either doing transplanting or at the very least targeting those few lions that are repeat bighorn offenders.

Lions are being OVER-killed in New Mexico at this point. NMGF is very secretive about these contract killing contracts. NMGF is not doing the hard work of actual science in order to have quotas that are sustainable.

I do not support these changes

Sincerely,
leslie patten

Please don't go away with the seasons for hound hunting. It's quite unfair to the dogs that are bred and live for the hunt. You wouldn't take working cattle dogs away from ranchers. Those dogs use the same force and techniques as hunting hounds but they are praised. It's no different, these dogs depend on laws and rules for their lively hoods. This is heartbreaking in so many ways I just wish a state would stand up for these dogs because nobody else will.

Please closely consider the affects of what losing hound hunting for lion and bear is doing in the western states. Please note the chaos and destruction currently going on in California due to out of control predator numbers. All other species of game animals are in dangerous declines. The money spent by the state of California to handle problem bears and lions is ridiculous. Conversely, revenues from licenses and tags have a huge impact on all aspects of game conservation.

We appreciate your careful and data based insights and considerations on this matter.

I am contacting you in support of hound hunting bears and cougars. Hunting predators with hounds is a selective way to identify male from female. It helps to control predator numbers and problems. Living in WA state I am all too familiar with the problems we have with predators on our deer and elk herds, and conflicts with people, since hunting with hounds was band years ago. Hounding hunting is a tradition with families that goes back many generations and would be a tragedy if lost. We as sportsman and conservationists need to use solid, proven science and management to make decisions. Not our egos or pocket books.

Thank you
Mat Weiler
Yakima WA.

Dear dgf-bears-cougar-rules,

Hi, I'm Mahonri Murphy and I have used hounds for hunting for a few years now and have seen the amazing sport that it is for bears and mountain lions. It would be a shame to not let future generations experience hounding for bears in your great state. I've seen the rise of bear number on the coast since they have ban houndsmen from hunting. The bears start getting more comfortable with going into towns and eating pets and from trash therefore making neighborhoods less safe for kids to be kids.

I have seen first hand how devastating mountain lions can be unmanaged with dogs. I've seen them eat childhood pets and people's live stock. It is alot easier to prevent this from happening with the uses of dogs then with people trying to hunt them my foot. As you guys probably know cats are very elusive and we **NEED** hounds to fill in the gaps between our stamina and there smarts.

Please don't take away the opportunity to keep hounds run in your great and wonderful state.

Thanks for your time,
Mahonri Murphy

To whom it may concern,

The citizens of New Mexico once again come under attack from extremists. At what point is enough enough? It's bad enough that so much bear / cougar habitat is behind locked gates and difficult to hunt with hounds. Now we have to worry about ending hunting with the use of hounds?

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The states predator population is already a problem and was even before the trapping ban.

The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example.

One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Thank you

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Using hounds is the best technique for controlling lion and bear populations. Western states that banned hound hunting big game has seen predation on humans increase, populations explode, and ranch animal predation increase. Using hounds is a tradition and a way of life. The houndsman is not a cruel, abusive person that beats his dogs. Most hounds I see are better taken care of than 90 percent of overweight house dogs. Fed premium food, routine exercise, worming/vet schedules, taken out more than Fido gets let out of the back yard. My hounds are my family and they hold an important place in conservation.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

I support the NMDG&F bear and cougar rule change proposal. The game commission should take some important steps to protect our state's hunting heritage from criticism from non-hunters. During the last legislative session a bill failed to pass that would have required hunters to remove the edible portions of bear, cougar and javelina from the field. Enacting such a requirement would do much to head off anti-hunting sentiment.

The game commission needs to do what it can to enact and support prohibitions on the waste of game including bear and cougar and other game species. Hunting bears and cougars is a longstanding tradition for many New Mexicans and people who travel to New Mexico from across the country. In addition to providing conservation funding, economic benefits from outdoor recreation, being a critical population management tool and bringing families together in the outdoors, the harvest of a bear or cougar provides countless nutritional meals for the lucky hunter and all those he/she shares the bounty with.

Sincerely,
Gaelan Chutter-ames

Dear Commissioners,

Watching the fallout from the trapping ban has been a sobering experience. It underscores the dangers of compromising with groups that often seem to have a narrow focus. I hope we can stand firm against such pressures and maintain a holistic view of our state's ecosystem needs. Support the cougar and bear hunts!

Sincerely,
Levi Winger

Dear Commissioners,

History has shown us that hunters have played an invaluable role in the conservation efforts of regions like New Mexico. Their contributions, both tangible and intangible, have bolstered game populations and fostered a culture of respect for the wild. It's pivotal that we recognize these efforts and ensure that they aren't undermined. Bear and cougar hunts? I'm in full support.

Sincerely,
Dell Oliver

Gentlemen and ladies, Hunting is a tradition of the common man in the USA. elsewhere rules are written to reserve hunting for the empowered and elite. Currently nonhunters are pressuring wildlife managers and politicians to stop all hunting. The scientifically managed harvest of all animals is a hallmark of good conservation. Please continue the hunting of bears and cougars in New Mexico, it is our right and is appropriate for the balance of prey and predators.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

As a long-term (greater than forty years) resident of New Mexico, I object to recreational hunting (or harvesting) of any bear or cougar. Hunting of other game species, like deer and elk, is essential because we have eliminated, or significantly reduced, populations of predators that would maintain an ecologically sustainable predator:prey ratio. Any removal of bear or cougar contributes to increases in the already unsustainable populations of prey animals.

Elimination of problematic bear or cougar that, predate upon livestock, or otherwise harass humans or their livelihood, is undestrandably sometimes appropriate, but that is not to be confused with recreational hunting.

Prey harvesting, deer and elk for example, is necessary to maintain ecosystem balance, based upon ecological- and biological-science data. If there are similar scientific data that suggest that bear and/or cougar populations need to be reduced, please provide references to those sources. Absent any scientific data, I firmly object to any recreational hunting of bear or cougar.

Encountering bear or cougar in New Mexico's rural landscape is a rare and enchanting experience. These iconic New Mexico species deserve protection from, rather than being sacrificed to, trophy and recreational hunting.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Department of Game Commissioners:

Please DO NOT raise kill quotas on bears, extend hunting, and adjust kill quotas for cougars for the following reasons.

The science governing the maintenance and protection of our unique and endangered New Mexico ecosystem doesn't support any of these actions. Fire, increased drought, human/wildlife conflict and animal extinction can be the results of mismanaged and unsupported policy decisions.

Please carefully review what is known about these impacts and consider unintended consequences, as well as aggressively support solid research which can then support any policy changes. DO NOT MAKE ANY CHANGES UNTIL MORE IS KNOWN ABOUT THEIR IMPACTS.

Once your policies are set in motion, the negative cascading effects may be impossible to reverse. Our ecosystem, as you know, is at a tipping point. I don't want our grandchildren to ask, "were there ever bears and cougars in New Mexico?"

Just a little note from an old retired bear and lion hunter. First of all I strongly support the New Mexico Game and Fish. With all the game studies that they do I strongly believe that they know what's best for our game animals. Bear and lion are predators that need to be kept in check. California is a prime example of letting lions go unhunted and now they are attacking joggers, hikers and little kids.

I remember back in the late 60's, early 70's around Alto Village people were calling us every day to come and run off bears as they were tearing up trash cans and scaring people. I remember the Mescalero Apache reservation had a 2 bear limit back then.

I also remember when the Game and Fish put a band of Desert Bighorns in the peloncillo mountains of south west New Mexico and the lions about killed them all in no time.

If predator numbers are not kept in check then we will not be able to enjoy seeing the other species that we all love seeing on occasion. Let's listen to the NM Game and Fish and go with their recommendations. They are in the field every day and know what's best for our game animals. It is after all what we pay them for.

Thank you
Stan Armstrong

Hunting cougars without hounds is usually unsuccessful; hunting cougars with hounds is also difficult and frequently unsuccessful, but is a much better method.

Similarly, hunting bears in New Mexico without hounds is difficult and has a low yield. Hunting bears with hounds improves the chances of success. Both are humane methods.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I am writing to comment on the proposed increase in the number of Cougar hunting limits proposed by the DGF. I am strongly opposed to the increase in the limit as these creatures are an important and valuable apex predator as well as a historically present species in our state. Given the advanced technology that hunters are using (dogs with GPS collars), satellite data and incredibly accurate long-range rifles, the cougars have little chance to avoid being hunted and killed by hunters, even in the most remote parts of our state. I am a longtime resident of NM and an avid hiker, camper and user of our beautiful public lands here. Please consider declining to adopt the new, higher limits on cougars in order to maintain their presence in our forests and wilderness areas. Thank you for your consideration.

Dear NM Game Commission,

As with other wildlife, killing bears and cougars at random for recreation and trophies exacerbates conflict because trophy hunters target larger animals for their kills which then disrupts important social structures. When social structures are in place these animals can self-regulate their own numbers; it is not problematic to kill fewer bears and cougars.

These current proposals are reckless and don't apply the best science. They lack scientific rigor. Have you accounted for the intensifying of climate change into your killing quota increase?

Also, please consider the broad public opinion to adopt hunting rules that ban the use of dogs in cougar and bear hunting. This is so cruel.

Please do the right thing for the animals and there is no downside to lowering the numbers.

Thank you for your time.

Just a week ago, I had an issue where a cougar was stalking my horses. I have 2 very expensive speed horses that I compete in Mounted shooting with and cannot risk them getting attached, killed or injure themselves while trying to run away from danger.

The anti-hunting people most likely live in a city and have not experienced the fear of a 1200-pound animal whose only defense is to run. I have a game camera set up and the next time the cougar comes around I will shoot it. Unfortunately, because all the game is in our town, the cougars have no food in the country where they belong and have to go for domestic animals.

I think while the people who are against hunting need to understand that farmers and people like me are risking our animals to predators, the wildlife in our village needs to be thinned out and taken to the country so cougars will have a food source so they will leave farmers animals and any domesticated animals alone. This is bigger than just changing a hunting law in my opinion.

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The states predator population is already a problem and was even before the trapping ban.

The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences.

California is the perfect example.

One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

These people have no clue how to manage game.

I have hunted all my life and between hunters booked, guided and licenses bought have contributed millions of dollars to support the conservation of wildlife. They don't understand the importance of the balance of nature. I've been hunting lions for years and without dogs it is nearly impossible to harvest one. Even with the quotas issued there are so many it's unbelievable. Not every lion is chased because of size or sex they are left to reproduce and they are. We cut lots of tracks every year in areas that are heavily hunted and there's always lions. Bears can be hunted other ways but the bear population is high and in my opinion out of control in our neighboring state of Colorado due to no baiting, no dog hunting and very limited hunting opportunities. I personally think it has hurt the elk population. I have seen and talked to lots of people who have seen bears with calves in their mouths time and time again. New Mexico has done a great job on trying to keep the numbers in check. I hunt southwestern New Mexico a lot and there's still tons of bears there. You can find them all over the state despite how much they're hunted. Letting these non hunters tell us how to keep nature balanced is like letting a Walmart checkout person do open heart surgery on someone. They don't have a clue what's going on out there.

Sincerely

Lester Hawkins
Soaring Hawk Outfitters

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To whom it may concern,

Hound hunting for bears and mountain lions in New Mexico is crucial for population management and the overall well-being of the state. By carefully regulating these populations, we can maintain a healthy balance in the ecosystem. Banning hound hunting could lead to overpopulation, which can have detrimental effects on both wildlife and the state of New Mexico.

Hound hunting allows for selective harvesting, targeting specific bears and mountain lions that may pose a threat to human safety or livestock. This helps prevent conflicts and ensures the safety of communities. Additionally, hound hunting provides valuable data for wildlife management, allowing researchers to gather information about population size, health, and behavior. This data is essential for making informed decisions and implementing effective conservation strategies.

If hound hunting were banned, the bear and mountain lion populations could increase unchecked, leading to overpopulation. This would result in a strain on their natural food sources and potential damage to the ecosystem. Overpopulation can also increase the risk of human-wildlife conflicts, as bears and mountain lions may encroach on human settlements in search of food. This could impact the safety and well-being of both residents and animals.

In summary, hound hunting plays a crucial role in population management for bears and mountain lions in New Mexico. It helps maintain a balanced ecosystem, prevents conflicts, and provides valuable data for conservation efforts. Banning hound hunting could lead to overpopulation and negative consequences for both wildlife and the state. Responsible and regulated hunting practices are necessary to ensure the long-term sustainability of these populations and the overall health of New Mexico's natural environment.

Sincerely,
A Hound Hunter

We the hunters that hunt bear and cougars are the ones that keep the population down so that these animals stay out of neighborhoods and away from kids and are domesticated animals such as the family dog or cat or any other kind of pet you may have. You anti hunter I want you to go look and watch videos of this animals that come in to peoples home and attack kids or family pets or farm animal and then after you watch then give me your opinion, how you would feel if it was yours or someone you know how would feel then. Your local animal control can only do so much to help catch the animals and what comes after that is your games wardens and guess what happens they are more than likely going to put that animal down because wants they get a taste of water ever they are attacking and see how easy that prey is to get to they are going to keep coming back. Bears and cougars are just like you, me or anyone else in this world they get hungry and have their family to feed and they are going to do it anyway they can and go after that easy prey so by hunting them it keep them afraid of humans and out of the neighborhoods and everything and everyone you love.

I am a NM farmer and rancher and an outdoor enthusiast and hunter. Predator hunting is needed coyotes and occasional mountain lion have killed calves and calving cows on our ranch.

Allowing responsible hunting gives ranchers and landowners another tool to deal with predators and really any nuisance game animal. It also slows hunters to attempt to harvest a game animal. Bears and wolves are not a problem in our area, but they need to be hunted as well. A good balance is needed, and I feel that current rules are pretty good.

Thanks

Dear Sirs,

Please, please end all hunting of our stressed wildlife in New Mexico!!

Tragedies of global warming- produced wildfires already endanger the lives of wildlife.

Human hunting is cruel.

Bears and cougars are not just "game". They are a vital part of our forest ecosystems and our heritage.

Your jobs at Game and Fish should be focused on conserving wildlife ecologies.

Subject: [EXTERNAL] Hunting: An American Heritage And Valuable Wildlife Management Tool
Date: Thursday, August 24, 2023 9:12:10 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

I am a trained wildlife biologist. I have a bachelors degree in Wildlife Management (82 - USU) and a Masters Degree in Wildlife Management - emphasis Predator Ecology (85 USU). My Masters Thesis was on The Vulnerability of Cougars To Hunting. I worked as a Wildlife Biologist and Conservation Officer for 32 years (now retired).

Properly balanced wildlife management by the state wildlife agencies has been a huge success. Habitat research and enhancement projects, wildlife transplants, and science based regulated hunting regimen have insured healthy wildlife populations nationwide.

Cougar and bear populations are great examples of these success stories. Their populations have never been healthier across the nation. Using research based regulated hunting to balance apex predators with their prey base and mitigate depredation and predator-human conflicts is working very well.

Hunting bear with bait stations and hunting both cougar and bear with hounds allow the hunter to be very selective in the animal they choose to harvest. Young animals and females are released and hunters often selectively harvest larger males. Houndsman invest huge amounts of money and time into maintaining and training their hounds. And both they and their hounds live to hunt. They have a vested interest in maintaining healthy cougar and bear populations. And there is great peer pressure among them to not harvest females and young.

Where these predator populations are out of balance with their prey, or depredation on livestock or human conflicts are excessive, selective harvest with hounds is the only effective tool available to wildlife managers.

While I understand the well-meaning sentiment of anti-hunters that want to eliminate all bear and cougar hunting. It is very short-sighted and would become an ineffective solution to a nonexistent problem. It would cause imbalance between predators and their prey base and increase conflicts with humans and livestock depredation.

Please allow the professional wildlife managers to continue to use regulated sustainable harvest of cougars and bears as a management tool (really the only viable one). And allow those families that enjoy this hunting activity to maintain this heritage that many have enjoyed for generations.

Thankyou for yor consideration.

Dan Barnhurst
Retired Conservation Officer

Subject: [EXTERNAL] I OPPOSE INCREASED KILL QUOTAS
Date: Friday, August 25, 2023 11:19:19 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

TO WHOM IT MAY CONCERN: NM Department of Game and Fish

It has come to my attention that today is the last day to voice our criticism of the proposed new kill quotas and guidelines for bears and cougars in New Mexico.

I would like to add my name to the list of people extremely displeased with the proposition to increase kill numbers of our beloved wildlife.

The reasons for my objection are outlined below...

1) Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.

2) Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures.

3) Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.

Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless and cruel.

4) The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.

5) NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.

6) Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited. Moreover, given the newness of these studies, they

are only a snapshot of the current population in a given area. We do not yet have long-term on-the-ground field studies of bear and cougar populations throughout the state that could indicate population trends. Absent good data, the department should be exercising great caution with managing the population of bears and cougars.

Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for 'trophy' and recreation. Ask NM Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.

My objections are not limited to these arguments, but I believe this is more than enough to make you rethink passing these new measures.

I will conclude by reiterating that I STRONGLY OPPOSE increased kill numbers for Bears and Cougars in New Mexico, and as a registered voter I will be paying closer attention to such issues in the future.

Regards,

Elizabeth Rose

Subject: [EXTERNAL] I OPPOSE THE KILLING OF EVEN A SINGLE BEAR OR COUGAR!
Date: Saturday, October 14, 2023 10:42:10 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Trophy hunting is cruel, barbaric, and unethical - it should not be allowed in civilized society! I OPPOSE THE KILLING OF EVEN ONE BEAR OR COUGAR!

NMDGF's kill limits are largely not grounded in sound science and should be reduced by at least 50%.

In the case of black bears, NMDGF uses mostly outdated studies conducted in the best bear habitats and then generalizes the results statewide. And in the case of cougars, NMDGF relies on an old, flawed habitat model to set kill limits for the majority of cougar management zones, despite more recent and reliable studies demonstrating that this model produces inaccurately high population estimates.

NMDGF proposes to only count legal kills by hunters towards their kill limits, instead of all sources of bear and cougar mortality. Total mortality includes disease, predator-control kills, human conflict kills, road-killed wildlife and the significant amount of annual poaching. Failing to include total mortality in the kill limits means that an unlimited number of bears and cougars may be killed on top of the hunting kill limits.

The Southwest has been experiencing a "megadrought" from 2000 to 2023, the driest period since 800 A.D. As result, New Mexico also experienced the most severe wildfires in recent history, destroying habitats, food and wildlife themselves. The NM Game and Fish has failed to account for these factors in their habitat or population estimates. Climate trends weigh in favor of lowering kill limits, not raising them.

Trophy hunters use radio-collared hounds to chase bears and cougars in New Mexico—a method that is both cruel and unfair. THIS IS WHAT SLOB "HUNTERS" DO! IT'S SICK, SHAMEFUL, AND OBSCENE!

Hounding harms non-target species, including deer and domestic livestock and results in deaths and injuries to federally protected Mexican wolves, bear cubs, mountain lion kittens, and results in deadly fights between bears or cougars and hounds. Hounding can cause both wildlife and hounds to die from heat exhaustion.

Archery equipment is cruel and results in uncounted wounding losses. Because of their heavy musculature, allowing archery equipment to hunt bears results in prolonged deaths of bears and wounding losses that are never counted in bear kill limits.

Bears and cougars make New Mexico's ecosystems healthy and diverse. Bears spread more seed than even birds, and cougars leave carrion for multiple species, contributing to biological diversity.

Researchers have found that black bear hunting does not resolve human-bear conflicts, and, may in fact, worsen them. Trophy hunters target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory. Also, killing these large carnivores does not reduce attacks on humans—but keeping dogs on leashes and carrying bear pepper spray in in wild places does.

Hunting cougars and bears will neither bolster ungulate herds (like mule deer or bighorn sheep) nor make people safer. o Killing cougars, however, creates social chaos in their families resulting in even greater mortalities from intraspecific aggression. Randomly killing cougars or bears exacerbates conflicts between

these animals and people, pets and livestock. It can even intensify losses of rare prey animals such as bighorn sheep. o Bears' diet is comprised of more than 90% plant materials. • Living black bears and cougars hold intrinsic, social, and economic values, and provide incalculable benefits to their ecosystems.

The American public opposes trophy hunting by 2/3rds majorities. Ask NMDGF to consider broad public opinion, adopt hunting rules that ban the use of dogs in cougar and bear hunting, reduce the proposed hunting kill limits by at least 50%, and include all human-caused sources of mortality in the kill limits.

To :
NM Dept. of Game and Fish

Dear Madam, dear Sir,

Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans.

Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity.

Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to your state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans.
Your state's wildlife deserves better.

Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Sincerely,

Chantal Buslot Belgium

Subject: [EXTERNAL] I Oppose Recreational Hunting
Date: Thursday, August 3, 2023 4:34:32 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I strongly oppose the recreational killing of bears and cougars, Quite frankly, it is horrifying that NM Game and Fish condones and authorizes killing just for kicks. Has history taught us nothing? State residents have to question who are the real decision makers in this department, Sounds to me like the NRA is in control.

When under strong and intelligent leadership this country has tried to restore the natural habitat of the land and all her native species, and rid the landscape of invasive plants and animals. Mother Nature is a thousand times more intelligent than those people who believe THEY control HER and can kill indiscriminately without dire consequences.

Is there no leadership with a backbone at NM Game and Fish that can stand up to the select few who believe it's fun to kill magnificent creatures just to stroke their egos? Bears and cougars belong on this land and should be respected and free to live without humans savagely hunting them like it was 1860.

For those that somehow gain enjoyment from killing just for fun, I recommend you send them to Florida to hunt invasive species with their bare hands. Species like the burmese python who, thanks to human stupidity, are currently devastating the native wildlife. They would be providing a much needed service to the native species and they would get their thrills killing.

Subject: [EXTERNAL] I Support Predator Management
Date: Sunday, October 15, 2023 9:38:06 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I am writing this today because of the concern that New Mexico will follow the examples of other states and ban predator management due to public opinion and not science based conservation methods. I 100% support the management of predators and the hunting (and trapping) of lions, bears, bobcats, coyotes and other predators. New Mexico has a diverse set of wildlife and that should be managed accordingly. As we can see in Colorado and Idaho the unmanaged approach to predators can lead to the plummeting of ungulate numbers and a drastic reduction of the number of hunter opportunities and ultimately money that comes into the state through the management of game species.

Sincerely,

Dustin Ashley

Subject: [EXTERNAL] I am a New Mexico resident and VOTER...Please Reject the bear and cougar rule to protect New Mexican wildlife
Date: Tuesday, August 15, 2023 6:00:24 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The states predator population is already a problem and was even before the trapping ban. The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example. One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Hello,

I wanted to express my support for the Game Commission keeping politics out of wildlife management decisions and for current management practices that align with the North American Model for Wildlife Conservation.

The Game Commission should continue to work with biologists, wildlife management professionals and use data to set and maintain healthy balances in both predator and prey populations.

Thank you Game Commission for listening to wildlife professionals and using scientific data to make wildlife decisions. Thank you for ignoring the private interest groups that do not align with best management practices and would have wildlife decisions made with subjective emotional attacks as opposed to biological data.

Sincerely,

Common Sense New Mexican

I support the current regulation on mountain lion harvest goals. I live in the mountains. Almost every person emailing you about opposing hunting lives outside of the mountains. They have no idea what they are talking about. They are mostly uneducated city folk that believe the antihunting lies that are being spread.

Please do not further restrict the people that support nmgdf. It should be a law that if you do not buy a habitat stamp with a license you may not have input on our policy.

As a lifelong New Mexican, hunter and conservationist I strongly support regulated bear and cougar hunting in addition to the changes being proposed by the NMDGF in the current 2023 rule making session.

It's imperative to put the resource first and use the best available science to make management decisions rather than conjecture and emotion. The methodology used by NMDGF in determining the data used to make these decisions is sound. Current population estimates and on-the-ground depredation reports point to an increasing population, more human wildlife conflict, and the unnecessary expenditure of conservation officer resources that would be better spent protecting our shared wildlife resources. It's important that New Mexico continue to manage predator populations through regulated public hunting and the purchase of licenses that generate rather than diminish revenue for the department and it's critical mission.

Thank you for your consideration,

Katie DeLorenzo

Dear New Mexico State Commissioner,

As a lifetime resident and hunter in New Mexico, I believe that proper management of all animals is critical. Bear and Cougar hunting are a necessary tool to maintain healthy game populations for all species. Our deer and elk herds are already suffering from wolf populations, poachers and poor management decisions. Bear and cougar populations need to be kept in check.

I support the proposed rule change for bear and cougar and I firmly support bear and cougar hunting.

Thank you for your time and consideration.

Respectfully,

Vincent Tafuro

I stand by the biologist proposal to continue the rule of hunting bear or cougar with dogs and for the privilege of responsible hunters hunting with dogs. I believe if we let anti-hunting groups reverse our rights as hunters it will have adverse affects, not only on taking away our hunting privileges but it will have impacts on the state economy and eventually affecting livestock loss even more. Not to mention that there will be more encounters with predatory wildlife which could lead to injuries and possible loss of human life and pet deaths. I am a pet owner myself and as a responsible pet owner I understand that public lands have many uses, so I know that it is my responsibility to keep my pet on a leash to keep them safe out in public lands and public streets, no difference!

Sincerely,

Mr. Pat Archuleta

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Please consider the American heritage of hound hunting when making your final decisions. To many of us houndsmen and women it is a lifestyle. Hunting bear and mtn. Lion is the only sure way to know what you are harvesting (if harvesting)as for male or female or size. If NM loses their rights to run hounds it will devastate many families and the population will go out of control for example what is happening in California, Oregon and Washington with humans being attacked or killed regularly and nuisance bear and lion in populated areas they should not be. Not to mention the effect it will have on the other wildlife that will take a hit from higher numbers of deaths do to over population of predators. Thank you for your time.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Please stop this insane proposal. Bear and cougars are necessary for our wildlife habitat. Your proposal isn't based on science.

I have lived in northern New Mexico for 30 + years and have never even seen a bear. I don't believe there are many in our state. I did not think it's worth it to decrease population.

As for cougars. We all love our cougars and seem to successfully cohabitate with them with no harm to humans.

We have built into alot of widldlife habitats creating a dwindling habitat for wildlife of all species. It's clear to me that hunting for sport is immoral.

Where I live we have many bobcats , some cougars, rarely a bear and we all live successfully with them. They are a source of great joy for this community.

We need our bears our bobcats and out mountain lions ... not
Hunters who wish to kill for sport or hunt them for any reason other than self protection.

Subject: [EXTERNAL] Input for rule change
Date: Wednesday, August 16, 2023 7:54:53 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Hound hunting for bears and mountain lions in New Mexico is crucial for population management and the overall well-being of the state. By carefully regulating these populations, we can maintain a healthy balance in the ecosystem. Banning hound hunting could lead to overpopulation, which can have detrimental effects on both wildlife and the state of New Mexico.

Hound hunting allows for selective harvesting, targeting specific bears and mountain lions that may pose a threat to human safety or livestock. This helps prevent conflicts and ensures the safety of communities. Additionally, hound hunting provides valuable data for wildlife management, allowing researchers to gather information about population size, health, and behavior. This data is essential for making informed decisions and implementing effective conservation strategies.

If hound hunting were banned, the bear and mountain lion populations could increase unchecked, leading to overpopulation. This would result in a strain on their natural food sources and potential damage to the ecosystem. Overpopulation can also increase the risk of human-wildlife conflicts, as bears and mountain lions may encroach on human settlements in search of food. This could impact the safety and well-being of both residents and animals.

In summary, hound hunting plays a crucial role in population management for bears and mountain lions in New Mexico. It helps maintain a balanced ecosystem, prevents conflicts, and provides valuable data for conservation efforts. Banning hound hunting could lead to overpopulation and negative consequences for both wildlife and the state. Responsible and regulated hunting practices are necessary to ensure the long-term sustainability of these populations and the overall health of New Mexico's natural environment.

Sent from my iPhone I'm going to try to be nice. But I spent a week in the Gila National Forest this last week and did not see 1 deer this is not good for NM hunters in the future. I feel like the game department and commissioners are not going to do anything about this. I have talked to a dozen hunters over the week and all think the same thing as I do. Predators are taking our wildlife because we have allowed our commissioners to listen to anti hunters who could care less about our wildlife it's an agenda that they have caved to. Trapping is eccential in controlling our predators and bear and mountain lions are killing off our fawn crop more and more every year including coyotes, wolves. Our commissioners need to listen to the people that are out there in the wild and seeing this. We used to have the best deer hunting in the west and we have lost that most precious thing we as hunters have had. It's sad

Requiring a license and abiding by current rules and regulations should be sufficient to satisfy state lawmakers. Those in the roundhouse need to frequent the State Parks and National Forests more often. I've seen bear at close proximity in Coyote Creek State Park, Junebug National Forest Campsite near Red River, and along the Cimarron river below Eagle Nest State Park. People shouldn't be afraid of bears, bears should be afraid of people. I was glad to see the Valle Vidal opened up to bear hunting. On my two elk hunts there, I was reluctant to enter the forests pre-dawn or remain after dark due to the many bears found in the south loop. And don't get me started on Cougars! When frequenting State Parks in my RV, my dogs usually want to get out pre-dawn for their walk, and I can't carry loaded firearms? Which species are you really trying to protect here? Gun control means knowing what you're shooting at, and hitting what you aim at.

Subject: [EXTERNAL] Keep Science in NM bear & Cougar hunting regulations
Date: Thursday, August 17, 2023 11:29:31 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico State Game Commission,

It has come to my attention that a large number of comments have been received and directed to your commission, from well intentioned but largely uninformed citizens who have argued for the cessation of Bear and Cougar hunting. This is in direct opposition to all scientific data and population estimates based on true research.

I would strongly appeal to you to please not give in to the emotional and uninformed plea from these people to stop hunting of both species. Currently our state enjoys healthy numbers of both bear and cougars as they are correctly and intelligently managed by the NMDGF. To change these two species to totally "protected" would result in devastation of our cattle ranching industry and our deer and elk herds as well. Both of which currently face tremendous pressure from a burgeoning wolf population. Ultimately this would of course seriously reduce the Apex predators themselves as they would run out of prey species, turn to livestock and then be eliminated to preserve private property of the ranchers.

The changes as proposed by NMGFD to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

I respectfully request that the State Game Commission prioritize the opinions of our department biologist and the recommendations developed from their science-based data such as non-invasive scat/hair sampling, remote/trail cameras, GPS collars, hunter surveys, landowner reports and other traditional measures.

Thank you for your sincere consideration of this request.

Respectfully,

Randy A. Ellison

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I want to let you know I support raising quotas on bear and lion. Also using hounds is the best way to manage these species. Using hounds is the only way to be selective in harvesting bear and mountain lion. Letting elk and deer hunters shoot at them is not a good way to manage bear and lion. To many sows and young bear and lion would be killed this way.

Thank you. John Evert

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Please consider keeping the seasons open for predators under the current rules and regulations. Without hunting an imbalance is in the future that could devastate other wildlife such as deer, elk, ibex, Barbary Sheep, recently populated big horn sheep. Also with expanding urbanization of many communities it could potentially endanger human populations, pets such as dogs, cats as well as multiple species of domesticated livestock.

Respectfully yours

Kenneth Hargues

Subject: [EXTERNAL] Keep the hounds running!
Date: Monday, August 21, 2023 10:14:49 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

As a big game guide here in New Mexico, I understand the need to harvest animals in the efforts of population management. This same methodology should apply the predator population as well. To make the effect season more successful, the use of hounds is almost a must.

There is a common joke among resident hunters, "that if you are worried about seeing a bear or a mountain lion while you are in the woods, just buy a tag and you're guaranteed to never see one." While it is meant in some humorous way, there is a lot of truth to the joke. The spot and stalk approach to hunting cougar and bear is wildly unsuccessful.

In order to be more to be successful in the management of the predator populations hounds have been the key to that success. Although it does sound rather violent or inhumane to the activist groups that are pushing for this law, the need is apparently greater.

Without the help of the hounds in the efforts to manage populations, I feel that larger predator populations will rise greatly in short amount of time with the amount of food resources that are available. With the increased population numbers, and the natural instincts, the territory that they will require is going to increase. This could lead to effect on the natural environment that has already established.

Making predators expand they're environment moves them closer to established communities and towns. This only increases the potential for encounters with these animals.

These are just a few reasons that we should continue allowing the hounds to do their job. There are so many other reasons that I can think of that would be in support of the houndsmen keeping their livelihoods, there is no need for a novel. Thank you for your time.

DGF,

I understand that you are considering raising the kill quotas for NM bears and cougars and I want to make several specific points:

1. The numbers of bears and cougars that are allowed to be hunted and killed is not based on sound scientific evidence. I know that DGF keeps records but there is no evidence that the populations of bears and cougars has increased to warrant killing more of them. These animals self-regulate as history has shown and their populations rise or fall based on the availability of natural food.
2. We are facing extreme weather events driven by climate change: increased temperatures, severe drought, loss of habitat, wild fires. All of these are already limiting the populations of bears and cougars and this will only increase. More killing makes no sense,
3. Hunting bears and cougars does not impact livestock as record will demonstrate. The number of livestock killed by bears or cougars is minuscule, at best. This is just an old tale that has no basis.
4. Killing more bears and cougars only degrades an already threatened environment. Nature needs balance and has evolved to maintain that balance. We are beginning to see what damage we are doing when we arbitrarily upset that balance.

For these reasons, and just plain common sense I ask that you drop this unnecessary rule change. We have only a short time to preserve the natural world that we all enjoy. Do not make more irreversible changes.

Thanks you, Sharon Dogruel

Dear Game Commissioners,

The current practice of science-based fish and wildlife management is the foundation of the American Model, and we support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture. Bear and cougar are an important economic resource to many New Mexicans. The right to access those resources has been challenged and, in some cases, taken away in some states due to organized opposition from groups unconcerned with the negative impacts of the loss of said rights.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

As public servants, I'd ask that you please continue to prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data, such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures, in primacy when considering possible changes to policies and rules.

Respectfully,

Abran Briseño

Subject: [EXTERNAL] Letter in Support of Predator Management via Hunting
Date: Wednesday, August 16, 2023 3:35:18 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Committee,

My name is Dr. Filipczak, and I am an assistant professor of chemistry at the UNM-Valencia Campus.

I am writing this email to express my deepest support for managing predators such as black bears or mountain lions via regulate hunting.

North American model of wildlife conservation is the most effective method of managing wild game which has been proven for more than a hundred years. Absolutely integral part of it is regulating numbers of predators by harvesting part of their population by hunters based on the quota established by wildlife biologist from the Game and Fish Department. From the ethical stand point, harvesting a black bear or a mountain lion is not at all different from harvesting an elk or a deer. From the ecological perspective, it is an absolute necessity as the populations of these species are on a big rise, and available habitat cannot accommodate further growth. Lastly, it is an extremely important part of a beautiful New Mexican culture which is still vivid for many residents, especially these from rural area.

There are examples of states (e.g. Washington state) who replaced traditional predator hunting seasons with state agency-managed shoot-out, and failed dramatically. Personally, I find hunting tradition which feeds on northern American model of wildlife conservation as one of the most attractive aspects of living in the State of Enchantment. It also unites many residents of this wonderful state regardless of their political affiliation. Any action that would result with replacing this tradition- and science-based model would be against vital and long-term interest of wildlife, wild habitat and all residents who love interacting with them.

If there is anything else that I can do to better support my statement, please do not hesitate to reach out to me.

Sincerely,
Piotr

Dear Commissioners,

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The state's predator population is already a problem and was even before the trapping ban. The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example. One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Sincerely,
Ian Elstrom

Dear Commissioners,

Protect bear hunting, protect cougar hunting! While it's easy to generalize practices across states, each region has its distinctive ecological and social nuances. New Mexico, with its unique biodiversity and hunting traditions, must consider its own history and challenges. Lessons from other states that underwent significant policy changes serve as reminders of the need for thorough, science-backed decision-making.

Sincerely,
Shawn Young

We need to keep the lion and bear hunting regulations the same. The department has done a great job managing these animals and NOTHING SHOULD BE CHANGED. Hound hunting is a great tradition in New Mexico and the state even has a memorial of Ben V Lilly hound hunter in Silver City. Hound hunting is a great tool to manage predators like lions and bears. We can sex and determined age of the animal by using hounds which allows the hunters to be more selective with Lion and Bears.

Hello there!

I'm writing this email in support of continuing the usage of hounds to hunt predators in your state. Wholistic wildlife management is essential, now more than ever. Regardless of social opinion, too many predators on the landscape disrupts the balance of all species. Every legal means should be retained in order to manage numbers to a level that supports healthy populations of both predators and their prey.

Thanks,

Chris Morgan

Banning and/or restricting the hunting of mountain lion and/or black bears in New Mexico would not be in keeping with the North American Model of Wildlife Conservation. The emotions of “wildlife conservation groups” who contribute nothing of value toward actual conservation should not outweigh continuing a science based approach to lion and bear hunting.

Respectfully,

Kirk Douglas

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Absolutely NO changes to increase bear and mountain lion kills.

The only changes should be to eliminate killing both of these animals.

They are part of our pride and joy in NM.

We have no desire to be like the killing fields of other western states.

Instead we should showcase these animals by not killing them.

As the Hornecker Report years ago stated we do not know an exact number of Mt lions so how can you set a kill rate?

Bears are searching for food and water in the drought and trying to survive. We need to help them ie. water and food drops....not kill them.

Why kill apex predators at all?!

Whoever put it out there from Fish and Game about this issue of increasing kills for these predators, should be fired.

Obviously they have no clue about science or animal welfare and should not be representing NM animals.

Take a job in the other western states if a Fish and Game employee wants to increase killing these animals.

I do not want NM to be like these other western states.

Instead we need to protect and preserve our heritage.

This is what an employee of the NM Dept of Game and Fish should be doing.

Listen and adhere to the science and stop being the yahoo dept of NM.

I heard from friends near Grants and Ramah that 6 Mt lions have been killed within 3 miles of Ramah recently.

And were these kills reported.....!
I doubt it.

So there you go on unreported kills.

You have no idea on the population of Mt lions...or bears!

Sincerely,
Beth McDonald

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico State Game Commission,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and I support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, I believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

I respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,

Colin Pahl

Dear New Mexico State Game Commission:

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

We respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,

Stephen Baker

Dear New Mexico State Game Commission:

Dear New Mexico State Game Commission,

It has come to my attention that a large number of comments have been received and directed to your commission, from well intentioned but largely uninformed citizens who have argued for the cessation of Bear and Cougar hunting. This is in direct opposition to all scientific data and population estimates based on true research.

I would strongly appeal to you to please not give in to the emotional and uninformed plea from these people to stop hunting of both species. Currently our state enjoys healthy numbers of both bear and cougars as they are correctly and intelligently managed by the NMDGF. To change these two species to totally "protected" would result in devastation of our cattle ranching industry and our deer and elk herds as well. Both of which currently face tremendous pressure from a burgeoning wolf population. Ultimately this would of course seriously reduce the Apex predators themselves as they would run out of prey species, turn to livestock and then be eliminated to preserve private property of the ranchers.

The changes as proposed by NMGFD to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

I respectfully request that the State Game Commission prioritize the opinions of our department biologist and the recommendations developed from their science-based data such as non-invasive scat/hair sampling, remote/trail cameras, GPS collars, hunter surveys, landowner reports and other traditional measures.

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

Thank you for your sincere consideration of this request.

Respectfully,

Melissa Moore

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

We respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,

Norman Gruner

Dear New Mexico State Game Commission:

Thank you for your hard work and dedication to New Mexico's wildlife and wild places. The North American Model of Wildlife Management is the foundation of science-based fish and wildlife management, and I support legal, science-backed bear and cougar hunting as an appropriate management tool. I fully support your efforts to advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time. As a conservationist, hunter, and lover of the natural world, I fully support the proposed changes to bear and cougar hunting rules in New Mexico. But public opinion alone is not what should drive decision making for such an important resource.

I respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures. While public support is paramount to the success of our wildlife and wild places, our management agencies cannot be swayed by opinions and emotions, both for or against any proposed rule changes. For those reasons I want to voice my support for the continued reliance on scientific, evidence-based wildlife management practices.

Respectfully,

Nicholas Heine

Dear New Mexico State Game Commission:

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

We respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,

Carlos Garzon Monsalve
6600 Jaguar Drive 710
Santa Fe , NM 87507

Dear Commissioners,

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The state's predator population is already a problem and was even before the trapping ban. The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example. One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Sincerely,
Ryan Little

I am writing to oppose extending hunting limits on mountain lions(cougars) in NM. As it is, our human expansion is already taking away a good part of their habitat, which will eventually drive them to extinction in our state. They are not a food source, so what is the point of hastening the path to their extinction? I have seen them in the Sandias and they are truly majestic animals. Hunters can stick to animals that at least can be used for food, such as deer and elk, rather than senseless killing for no other reason than a trophy.

Thank you for your consideration.

Sincerley,

Lori Peterkin

Hello NM DGF,

Please accept the following comment re: the proposal to extend mountain lion hunting limits.

I oppose this proposal because such an increased kill rate would be unsustainable to the state's mountain lion population.

Mountain lions are part of the predator prey balance throughout the Mountain West. They are an keystone species that is essential to this area. It is rare to witness this elusive animal, but I am honored to have seen them.

I am a hunter and respect all wildlife for the role each species contributes to the biodiversity of NM. I am surprised at this NM DGF anti-predator attitude towards mountain lions.

Please manage mountain lions sustainably like all wildlife species, so that they will continue to be part of the picture here. Do not extend the mountain lion hunting limits.

Thank you,

Meredith Taylor

Hi

I just read an article in the paper that your organization (New Mexico Dept. of Game & Fish)) is going to expand the number of mountain lions allowed to be killed for fun by trophy hunters. That is despicable. Lions, like all animals, should be protected, not assassinated by someone who wants to decorate their house with the lion's body parts.

Trophy hunting is not a sport. A sport is when two people or two teams with equal capability confront each other. There is nothing sportslike for a hunter to shoot a defenseless animal. I urge you to cancel this in the name of Mother Nature.

Thank you for your time.

Dear NM DFG,

I am asking that you please reconsider raising the bag count on Mtn Lions.

I understand that this is about revenue and where money is involved, logic does not always follow. Mountain Lions are keystone species and are already "hunted" with unfair advantages. Raising the limits to 16% from 10% will most likely prove to not be sustainable since other forms of mortality have not been taken into consideration.

Just as I have heard from Hunter Friends and an Outfitter friend about the decrease in numbers of the trophy Bull Elk, quite possibly in part due to too many tags and muzzle loaders that now shoot excessively long distances, the Mountain Lion population is headed for the same fate with this new proposed limit. Predators take out the weak, sick, old and young, while Hunters take prime animals.

Please have foresight into this proposed decision.

Thank you,

Debbie Merrill

Dear New Mexico Game Commission,

As a photographer who has roamed the Southwest since 1970, I am deeply concerned about the plight of predators, particularly cougars and bears in New Mexico.

1. In over 50 years of wandering and driving through the mountains, diverse habitats and wilderness areas of Arizona and New Mexico I have only seen one cougar and two bears. Hence, my sense is that these animals are increasingly uncommon, and I have yet to see any scientific data that states the contrary.
2. I'm deeply concerned that human impacts, habitat destruction, and climate change are further threatening cougars and bears, and virtually all wildlife populations. And, I have yet to see any valid scientific data that states the contrary.
3. The hunting of these animals with dogs is barbaric and unsportsmanlike. Hunting with dogs should be banned immediately.
4. The use of traps of any kind to catch and kill these animals is also barbaric and should be banned on both public and private lands throughout the state.
5. The hunting of cougars and bears around water sources should also be banned.
6. New Mexico needs to modernize its hunting and fishing regulations, and ensure that they are based on sound, modern science and best practices.
7. Quotas for the killing of cougars and bears need to be lowered considerably, and in my opinion there should be a 10 year moratorium placed on the killing of these animals until valid scientific data is collected.

Thank you for taking into account my concerns.

Signed,

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I would like to add my full support in agreement with the editorial in the July 30, 2023 editorial in the Albuquerque Journal about the proposal by NM Department of Game and Fish to allow the killing every year of an estimated 10% of the wild cougars and black bears. As pointed out by the author, Charles Fox, there is no scientific or community safety basis for allowing the recreational hunting of these animals. Instead, this policy comes across as the willingness of the NMDFG to gratify the hunting community's "fun" activity and to justify the Department with a source of self-supporting income. Regardless of the rationale behind this policy, these animals are native to this area, are not owned by the NMDFG, and deserve to be left alone in their natural environment.

Importance: High

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Leaders of New Mexico Department of Game & Fish,

NM needs its wild creatures to maintain the balance of natural life. Today's (7/30/23) ABQ Journal features an article entitled "Proposed rule authorizing killing of bears and and cougars is unethical and unscientific."

I believe your Department does provide positive service to protect NM game and fish. I've contacted your offices by phone and email when positive policies are highlighted.

However, the proposed authorization of killing up to 25% of NM's bears and cougars every year has no basis in reality! To my knowledge, Game & Fish doesn't even have a count of the number of bears and cougars in New Mexico! THIS MAKES NO SENSE!

These are my animals as well as the majority of New Mexicans who do NOT support the recreational killing of bears for \$47 each and cougars for \$43 each!! This is a proposed tragic give away of animals that belong to all New Mexicans!

Further, this makes no sense for nature in a time of Climate Change when our natural areas and creatures are already under extreme threats.

If hunters must kill critters, let them purchase and establish their own killing range fenced off from designated natural areas by electric fences to prevent exit of their animals and entry of New Mexico's wildlife that should be protected. Hunters can then raise animals to hunt and kill on their own range by paid members of their private area.

I'm including NM legislators on this email for consideration on the next session's agenda.

NM needs its wild creatures to maintain the balance of natural life. This is even more crucial than ever given the reality of Climate Change.

Thanks for your attention.

Susan Selbin

Hello,

I just wanted to express my support for the hunting and therefore the conservation of the MtnLion and black bear populations in the state of New Mexico. I think the importance of proper management of these species cannot be overstated. Without keeping the population in check, many problems arise for not only the public but for the G&F department.

I also feel that the management of these species is best left in the hands of your biologists AND the houndsmen of New Mexico. The houndsmen operate with the good of the species in the forefront of their minds when on the hunt. Most houndsmen refuse to take animals that are not males or animals that aren't mature. This allows for the most effective and efficient management of these species. I feel that without the houndsmen, the populations of these species would be in worse shape

In addition to management of these species, I also generally support mandatory check ins so that the animal can be inspected and aged by a qualified individual. I wish all states had check ins for all species, the harvest data would lose any bias it ever had

Respectfully,
Patrick Wundrock

Good evening,

I just wanted to take a moment to show my support for science-based management of bear and mountain Lion in the State of New Mexico. It is extremely important that these, and all other game species, are managed in such a way as to protect the rights and traditions of hunters, ensure healthy populations, and preserve the future. This is not something that can be accomplished through the popular vote but only through the proven methods and means laid out by qualified individuals in the Science community.

Thank you

Dear Commissioners,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

We respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Sincerely,
trent strickland

To New Mexico Dept. of Game and Fish:

As regards the current proposal, which I as a resident of this state very strongly oppose, to raise the kill quota for New Mexico bears and cougars, some intelligent thought needs to be applied here because it seems very little, if any, logic is at play.

Bears and cougars are not likely to overrun New Mexico. Both species are capable of self-regulating their numbers. Since there are no specific census counts on either of these species to support what the Department is proposing how can increasing the killing of them make any sense at all? As it is they, like other wildlife, are now struggling with the effects the climate change crisis is inflicting on us all and which will, undoubtedly, worsen before, or if, things ever get better. These issues alone must ultimately negatively affect the health of bear and cougar populations to continue to survive as viable species. Plans to purposely reduce their numbers even further when there is really nothing substantial or concrete to support such plans is absurd.

Bears and cougars play a vital role in environmental balance. This is not debatable. Furthermore, it is undeniable that human misuse and abuse of the natural world has directly caused much, if not most, of the problems we are now experiencing. This planet's continued longevity and ability to support life in any sort of tolerable way depends on maintaining a delicate balance in which all life forms play an important role. Such a balance can only be maintained if and when we recognize that we are only a part of a greater functioning whole—NOT the supreme commanders over all of it.

The hunting proposal revamp appears to cater to a specific segment of the population that enjoys what they label "hunting" but which, as practiced, is really blood sport. Wildlife is NOT expendable to suit humans—least of all for so

called recreation. Increasing the kill quotas for bears and cougars by pandering to trophy hunters is unreasonable, unethical and totally irresponsible—not to mention just plain cruel—and reflects a chilling and meaningless waste of life that should be neither encouraged nor promoted. Maybe hanging a head or pelt on a wall was admired in the days of the Wild West but certainly we must have progressed, at least a little, beyond that attitude.

Please do NOT go forward with enacting this proposal. New Mexico could, and should, be a state that stands as an example of responsible stewardship of its environment and all the species who live here. They are all to be valued, respected and protected—definitely not eliminated. Bears and cougars are a special segment of our population. Their importance cannot be ignored.

Thank you for considering my viewpoint.

Respectfully,

Linda Young

Dear New Mexico State Game Commission,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and I support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, I believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time. I would also add that a multi-state program to catch and release Lions into areas of deer over population should also be considered. Predators (including man) should be apart of any healthy ecosystem.

I respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,

Lee Anderson

I am totally against the proposed increase in numbers of cougars and bears allowed to be killed by hunters in NM.

This is ridiculous in our modern era of a new understanding of ecosystems and the appropriate management of wildlife.

I call on our Governor and legislators to finally put a stop to the poor management and bad decisions of our NM "hunting and fishing" Dept. This state of New Mexico department, paid for with our taxes, is apparently only run to keep hunters (and especially those large game ranches mostly owned by Texans) happy and to acquire funds through hunting and fishing licenses. The dept is NOT run as a 21st century wildlife management and conservation agency.

Enough is enough! Stop catering only to hunters and start representing the rest of the public in our state who want to conserve our wildlife - not kill it.

Hello,

I live in New Mexico and am an avid Hunter and love of New Mexico public lands and resources. I have been fortunate to hunt elk, deer, javelina, Barbary sheep, and Turkey And got an oryx tag this year! While I don't hunt mountain lions, I do want to get a bear tag sometime soon. Responsible legal bear and mountain lion hunting is good for the people, the land and the populations of all of New Mexican wildlife. Please keep bear and mountain lion hunting legal. I, of course, only want it legal if the populations can be sustained and healthy in accordance with biologist recommendations. Thank you!

Subject: [EXTERNAL] New Mexico Cat and Bear hunting via hounds
Date: Sunday, August 20, 2023 5:00:11 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

I am very disappointed that consideration is being given to outlaw the use of hounds for cat and bear hunting in New Mexico. I have hunted both species with hounds in New Mexico 5-6 times over the last 20 years. Knowledgeable Hunters are very selective and only shoot males.

It is very difficult to hunt lions via spot and stalk. Possible for bears, but not very productive. Doing away with hound hunting lions, will really negatively affect your mule deer population, and to some degree you elk calf recruitment.

Game management isn't a popularity contest; it's about making informed decisions that best serve the ecosystem and our local communities.

The first big mistake you made was doing away with trapping on public lands. That too will have a very negative effect on Mule Deer numbers. Just give it some time.

Please do not another wildlife management mistake.

I support the cat and bear hunts in NM.

New Mexico Department of Game and Fish
1 Wildlife Way
Santa Fe, NM 87507

I recently learned that New Mexico Game and Fish wildlife managers are considering increased hunting limits for black bears and cougars in New Mexico, citing indicators that populations are growing in some areas of New Mexico and thus should be reduced.

I have reviewed the agency's public document available for review **Bear and Cougar Rule (5/18/23)** and do not see the metrics supporting an increase in hunting limits nor an increase in demand for these types of trophy hunting licenses from the public. I also do not see that the agency is taking into account the environmental impact factors on current and future animal populations, such as climate change, drought and ever-increasing wildfire occurrences. As the agency charged with "Conserving New Mexico's Wildlife for Future Generations," I strongly believe that NMGF's adjustment to this policy will have significant economic and ecological harm to our state.

Your agency knows that cougars and bears are an important part of the ecosystem and play a unique ecological role. They help foster plant biodiversity by keeping deer and other herbivores in check. By removing sick individuals and reducing the spread of deadly diseases such as chronic wasting disease, cougars help stem an epidemic plaguing deer and elk herds throughout the country. They also supply bobcats, coyotes, ravens and other scavengers with a steady stream of food, a particularly critical service during winter and other lean times. Just as beaver ponds create habitat for fish, amphibians and other species, cougar kills create habitat for nature's janitors, insect "decomposers" that break down rotting flesh and liberate nutrients for soil microbes and plants, an ever-pressing need in our fire ravaged forests where soil health has been severely compromised. It is also well known from that Increasing hunting quotas can lead to overhunting of the healthiest animals which can have cascading negative effects on the entire ecosystem.

It is now universally accepted that we are facing a global extinction crisis with thousands of declining species worldwide. Healthy ecosystems depend on the full range of species, which includes top carnivores. When the healthy balance tips by taking too many top carnivores out, humans then need to play the role of ecosystem manager, a role that humans have clearly failed at providing. Though economic "benefits" of trophy hunting proceeds may be easier to quantify than ecological benefits, this trade off approach needs to be determined and guided by ethical concepts.

Research indicates that the majority of New Mexicans and Americans hold positive attitudes towards cougars and bears. NMGF should support policies that respect the wishes of their citizens to protect these species rather than increase trophy hunting limits.

We all benefit from healthier ecosystems which have a better chance of surviving the climate crisis. Our citizens and the non-human life that we share this beautiful state with, have a right to live healthy and fulfilling lives. And we have a responsibility to provide the same for future generations of New Mexicans.

Thank you for taking my comments into consideration.

Date: Thursday, July 20, 2023 6:29:01 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To All whom this may concern,

I am writing this email rather than attending the meeting that New Mexico Game and Fish is holding July 21, 2023. I am at my cabin in the mountains of northern New Mexico where the internet is unreliable. What we lack in modern convenience is more than made up for by the natural wonders that grace our beautiful state.

The mountains, forests, lakes, rivers and all of the creatures (including humans) that make this special place home are my concern. I think it takes living here to really appreciate how the puzzle pieces of nature interlock, it's an intricate system that scientific study continues to reveal. This wonderful puzzle includes everything from the tiny "no see 'em's" to the apex predators, cougars and bears. All are very important to the health of this mountain system.

Therefore, I am asking that in the interest of all who share these wild lands, that the raising of kill quotas of cougars and bears be suspended until a thorough scientific study be done to determine what the population of these species actually is. We can't successfully manage what we don't know.

Bears and cougars are not really food animals, maybe occasionally a bear is eaten but I've never heard of anyone sitting down to cougar. Killing them for sport or trophy is cruel and unnecessary especially when we really don't know the population count of either. By raising the kill quotas we are tampering with a fragile system. Taking out the largest specimens for trophy badly weakens the system and also leaves orphans, many of whom aren't prepared to care for themselves which will further reduce populations in an uncontrolled way.

In closing I'm asking all agencies to be willing to take the time to let science determine by how much and when we raise quotas. We must manage with great care. It's so easy to destroy a natural system and so very difficult to rebuild one.

Respectfully,

Natalie Collison

Good afternoon:

I am in your Raton district, just outside of Guadalupita on Coyote Creek. Our bear sightings and evidence of bears have declined year after year for 14 years now. The same can be said for cougars. We are wildlife watchers, and work on restoration and enhancement of habitat on our land for the benefit of wildlife. We may not be hunters anymore, but we are a part of your constituency. I ask that you base your management practices on science based population studies and ethical management practices. Raising the kill quote on bears and continuing to allow the decline of cougar populations is not justified based on our personal observations.

I might add that hunting with dog packs and baiting is not ethical hunting, and is outlawed in several states. In addition, it is time that you became the Department of Wildlife, and dropped your anachronistic insistence on calling wildlife game, and not calling fish wildlife.

Sincerely,
Raye Malzhan

I am very opposed to upping the numbers of animals to be killed. Climate change will kill off enough species, we humans don't need to kill unless it is for food or protection. Even predators like wolves and cougars have a role to play in the environment, killing them could cause an imbalance in nature that might never be corrected. Please either keep the current quotas of bears and cougars, or lower them. Sincerely, Mary Holden

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

We believe that we represent the vast majority of New Mexicans who enjoy the outdoors and the beautiful lands and wildlife of New Mexico but choose **not** to hunt and kill our wildlife such as bears and cougars. For that reason, we are adamantly opposed to any rule (19.31.11) which would increase the number of bears and/or cougars that are killed by hunters. We are not convinced that NMDGF has established a scientifically sound approach to bear and cougar management. We believe they are being influenced by a vocal minority of New Mexicans who hunt these animals. The funding for the NMDGF relies on fees and licenses for hunting permits, so how can they be objective when deciding hunt numbers or permit numbers?

In the last 100 years scientists have learned that predators are a valuable and necessary part of an ecosystem. Our native bears and cougars should be considered keystone species, that whatever affects these animals also affects the habitat and other wildlife in the area.

Currently we are seeing dramatic changes in our climate with historically low precipitation. With the added stresses due to Climate Change, our wildlife is under increased threats beyond just hunting. Such changes will significantly affect the amount of food available to wildlife and cause even more stress to our wildlife and lands than we have ever seen before. Now is not the time to make changes in any rules which would further reduce the numbers of bears and cougars in New Mexico.

We are particularly opposed to the use of dogs in these hunts. Having radio-collared dogs chase bears and/or cougars until near exhaustion is not hunting. When the exhausted animal finally climbs a tree in an effort to escape, the hunters, who have followed the dogs by radio, can easily shoot and kill at point-blank range. There is no avenue of escape for an animal in this situation. How does this protect a mother with cubs? How is this ethical or even considered sport? It is not. We believe that if New Mexico voters were asked to vote on allowing dog hunting of bears and cougars, they would overwhelmingly reject this out-of-date activity.

I believe that the hunting of bears and cougars should be suspended until sound scientific evidence is provided that the hunting will not significantly harm the current population of bears and cougars in New Mexico. These are a keystone species and affecting their populations also affects the habitat and wildlife in the area. I believe that the majority of New Mexicans would support having a strong, viable population of bears and cougars in New Mexico versus the small minority of people who want to kill them.

I reviewed the bear data sheets provided by the NMDGF and found in a footnote that the

estimate for the bear populations was based on a studies done in 2001 and another by I believe a graduate student in 2015. I sent an email to NMDGF asking them if they had more current studies to support their population estimates and never received a reply. If in fact the population estimates are based on these old studies, then more current work needs to be done before increasing the kill limits.

Hello, I a hunter. I would like to speak about the new bear and cougar rules. I feel there is no need to make a rule change due to the fact bears and cougars are making great population boosts in many areas of NM. Keep the hunting regulations the same. The goal limits are meet keeping the populations in check but with room to grow. Let's not make the mistake like stopping trapping. The coyote numbers are growing out of control and now coyotes are coming closing to residence causing problems. Home owner are seeing coyotes on a daily basis. Coyotes are attacking pets and causing a concern to humans. The best practices should be if it's not broken Don't try and fixes it.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Kill more, more, more. Kill, kill, kill! Why? What's the point ? What is the motivation? What lobby is pressuring you? What's wrong with people here?
How many dead mountain lions hanging on hunters' walls do we need?

If NMGF does not know the total death rate of cougars from all causes, there is no basis to add more permits for hunting. With so few cougars in NM, isn't there a risk that the remaining cougars cannot sustain a healthy population? Until u have the requisite information, let the animals alone. Let nature control populations.

Have you considered that the increased cougar and bear killing decreases the opportunity for me, a wildlife photographer, to encounter these beautiful animals in the wild. What about my rights? How about setting aside large areas where hunting, as well as running cattle, is prohibited, so nature enthusiasts can see nature as God intended it.

To Whom It May Concern:

On behalf of the Humane Society of the United States, Animal Protection New Mexico, the Rio Grande Chapter of the Sierra Club, and our members and supporters in New Mexico, we thank you for this opportunity to comment on New Mexico Department of Game and Fish's four-year, proposed rule for black bears. Given the immense uncertainties New Mexico black bears face, we request that NMDGF reduce their proposed bear-kill quotas by at least 50%. We provide a summary overview of our comments and full, cited comments follow.

Summary:

A. New Mexico's black bear population density and abundance determinations made by department of Game and Fish personnel have been wholly insufficient, are undiscoverable and therefore must be assumed to be scientifically indefensible. Since the public has not been provided with tangible reasons to trust the department's conclusions, the Game Commission must lower statewide black bear quotas. The NMDGF has redacted (blacked out) population data from our public information requests, making a study of their population calculations (peer review) impossible. The process involving NMDGF's proposal to raise the black bear quotas has been unnecessarily secretive, and the public has been kept in the dark. Instead, NMDGF initially developed a document totaling 1.5 pages that encompassed both its proposed black bear (*Ursus americanus*) and cougar (*Puma concolor*) rule changes and then suddenly updated that document with a few more pages in early August. NMDGF will accept comments on its proposed rules until an unknown date in September, at which time it will prepare final draft rules for both bears and cougars that will be posted to its website. It is uncertain if the public will have an opportunity to review and comment on these final draft rules before the Game Commission makes its decision in October. The public has little information about the studies NMDGF relies upon to make population determinations, and we have seen no population management objectives (other than implicit hunter satisfaction and future hunting opportunities). In other words, the process by which these rules were drafted and the public engaged, is a failed course of action.

NMDGF's bear-population determinations are based upon an unscientific and crumbling foundation because New Mexico's bear studies are woefully outdated. Those old studies were conducted in New Mexico's best bear habitats. Then NMDGF took those high-density numbers and mysteriously generalized them statewide—artificially inflating estimated population figures that likely have no basis in reality.

NMDGF has not embarked on year-to-year population studies so it is not possible to know how bear populations are trending and thus whether current hunting is sustainable, much less whether increasing hunting quotas will be. NMDGF's claims, that New Mexico bear management is sustainable, are not backed up by current empirical data.

NMDGF has not factored in climate instability into its bear hunting proposals. It has not considered the 20-year *megadrought*—a drought not seen since 800 A.D.—and the historic wildfires which killed bears and destroyed their habitats, including last year's wildfires (the largest in New Mexico's recorded

history), into its quota-setting process. Because New Mexico's bear population suffers from low genetic diversity, because those populations are poorly connected to others and because the climate crisis will only worsen, New Mexico's bears face a bleak future that will not be able to withstand over-hunting.

When an activity potentially threatens the environment, the *precautionary principle* warns that the proponent of that activity assumes the burden of proof and must act with restraint. NMDGF has not met this burden but rather has thrown caution to the wind with bear quotas that are likely to damage New Mexico's black bear populations. **For those reasons, the Game Commission must lower statewide black bear quotas to prevent inbreeding and the loss of bear populations that are uniquely adapted to New Mexico's arid habitats.**

- B. NMDGF proposes not to count all sources of bear mortality as part of its quotas, including disease, predator-control kills, human-bear conflict kills, road-killed bears and the significant amount of annual bear poaching.** Black bears are slow to reproduce and can only withstand **between 4% and 10% total mortality**, and failing to include total mortality amounts to flawed wildlife management. For all of these reasons, **the Game Commission should not only reject any increase in hunting quotas but also should call for quota reductions statewide.**
- C. Hounding bears with packs of radio-collared hounds is not fair chase hunting and using archery equipment is cruel and results in uncounted wounding losses.** Hounding harms non-target species, including deer and domestic livestock and results in deaths and injuries to *federally protected Mexican wolves*, bear cubs, and results in deadly fights between bears and hounds. It causes both bears and hounds to die from heat exhaustion. Using archery equipment to hunt bears results in prolonged deaths of bears and wounding losses that are never counted in bear quotas. For these reasons, **the Game Commission must abolish hound hunting of bears and the use of archery equipment to hunt bears.**
- D. Researchers have found that black bear hunting does not resolve human-bear conflicts, and, may in fact, worsen them. Also, trophy hunting bears does not reduce attacks on humans—but keeping dogs on leashes in bear country does.** NMDGF must engage Bear Wise or Bear Smart strategies to prevent future conflicts in both urban and rural areas—because human-bear conflicts are entirely preventable with planning.
- E. New Mexico's wildlife managers should develop a comprehensive management plan informed by the best available science.** That management plan should clearly spell out goals and objectives so the public and decisionmakers alike are not kept in the dark. No such plan currently exists. The public is being kept in the dark about even the most basic aspects of the department's bear management plans in New Mexico.
- F. Family oriented black bears hold intrinsic, social and economic values, and provide incalculable benefits to their ecosystems.** Highly intelligent, devoted black bear mothers spend up to two years raising their very few cubs they produce. Among other myriad benefits they provide, bears also spread more seed than birds. Furthermore, the public loves viewing and photographing bears. For these reasons, the Game Commission must conserve and protect black bears for future generations.
- G. New Mexico law confirms that black bears must be conserved for all citizens.** It is axiomatic that “agencies are created by statute, and limited to the power and authority expressly granted or necessarily implied by those statutes.” *Qwest Corp. v. New Mexico Pub. Reg. Comm’n*, 140 N.M. 440, 446 (N.M. 2006). Thus “the Legislature, not the administrative agency, declares the policy and establishes... standards to which the agency must conform.” *State ex rel. Taylor v. Johnson*, 125 N.M. 343, 349 (N.M.

1998). Here, the New Mexico Legislature created the Game Commission in order “to provide an adequate...system for the protection of the game and fish of New Mexico” and “to provide for their... protection, regulation, and conservation...” N.M.S.A. § 17-1-1. In promulgating rules and regulations pertaining to hunting, the Legislature expressly directed the Commission to give “due regard” to “the distribution, abundance...and breeding habits” of particular species. N.M.S.A. § 17-1-26. And, like all New Mexico agencies, the Game Commission may not establish rules that are “not supported by substantial evidence” or that are enacted “arbitrary or capriciously.” N.M.S.A. § 39-3-1.1(D). Taken together, the statutory scheme authorizing this rulemaking requires evidence-driven, scientific management that seeks to sustainably maintain wildlife populations.

H. Conclusion. Because so many uncertainties exist with NMDGF’s proposed black bear rule, we provide these comprehensive comments, including **all journal articles cited herein as part of the administrative record and are available here: https://drive.google.com/drive/folders/1u_FIDR1428yw5ZInlPf3GqeTeorOfDJJO?usp=sharing**. This is done with the hope that the final rule will be informed by sound science and developed with clear objectives and goals, including for reducing human-bear conflicts, ensuring that black bear populations in New Mexico are genetically fit for long-term adaption in the face of so many threats to their persistence, including loss of habitats and travel corridors, extreme droughts, and severe, wholly unprecedented wildfires.

The Game Commission must reject the proposed black bear quota increases as they have no basis in science and could lead to the loss of New Mexico’s uniquely adapted bear populations. The Game Commission must include in its final quotas all sources of mortality. Given the immense uncertainties New Mexico black bears face, we request that NMDGF reduce their proposed bear-kill quotas by at least 50%.

To prevent the harm to non-target species including Mexican wolves, deer and domestic livestock the Game Commission must disallow the hounding of black bears. Hounding of bears is a controversial practice that is not fair-chase hunting, and has no place in New Mexico’s hunting regulations. The Game Commission must also disallow archery equipment to hunt bears because it does not result in quick, clean kills but prolongs a cruel death that can result in dead bears not being counted toward quotas. Black bears are ecologically important to their ecosystems. They hold inherent values and are much beloved by the public. The NMDGF must create a comprehensive rule supported by scientific justification for management of black bears and begin to work on a credible, long-term black bear management plan that outlines goals and objectives, including conserving New Mexico’s black bears for future generations. Additionally, we believe the public has the right to expect NMDGF to disseminate final draft rules, along with discoverable and detailed scientific justification for those rules using the best available science, rather than providing vague, indefensible, incomplete, and incoherent rules that shift throughout the comment process.

Thank you for considering our comments.

Sincerely yours,

Wendy Keefover

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To Whom It May Concern:

Thank you for this opportunity to provide you with our comprehensive comments on New Mexico's cougar rule. Please see our comments attached. We respectfully ask that the Game Commission **not adopt** the proposed cougar rule as it is now written.

Based upon the best available information, New Mexico Department of Game and Fish has grossly over-estimated New Mexico's cougar population in cougar management zones A, C, D, E, G, H, I, J, K, L, M, N, O, P, R, S and is causing severe overkill of those populations.

Because so many uncertainties exist with NMDGF's proposed cougar rule, we provide these comprehensive comments, including all studies cited herein as part of the administrative record (which we will make available to you through a Google drive). We do this with the hope that the final rule will be informed by sound science and developed with clear objectives and goals, including the science about cougars and their prey, the paucity of livestock conflicts, and ensuring that cougar populations in New Mexico are genetically fit for long-term adaption in the face of so many threats to their persistence including loss of habitats and travel corridors, extreme droughts and severe, wholly unprecedented wildfires. We are in the midst of a climatic crisis, which NMDGF ignores at its peril.

We oppose attempts to use population models (e.g., IPMs) that the agency has already admitted are problematic because they inflate population estimates. Instead, it is essential that NMDGF estimate New Mexico's cougar populations using peer-reviewed, empirical research conducted in New Mexico (e.g., Murphy et al. 2019).

NMDGF must include all sources of mortalities including hunter kill ("harvest"), predator control (ostensibly to bolster wild prey populations or protect domestic livestock), poaching, disease, known natural mortalities and roadkill as part of their quotas to prevent overkill of New Mexico's rare cougars. This change in policy makes no sense, and serves to undermine cougar conservation in New Mexico.

Hunting or "controlling" cougars will neither bolster ungulate herds nor make people safer. Persecuting cougars, however, creates social chaos in their families resulting in even greater

mortalities from intraspecific aggression. Randomly killing cougars exacerbates conflicts between cougars and people, pets and livestock. Randomly killing cougars can even intensify losses of rare prey animals such as bighorn sheep.

This public process on the cougar and black bear rule has been nothing short of vexing. We ask that NMDGF, in the future, disseminate one final and thoughtful draft rule instead of giving the public a shifting ground upon which to comment. Doing so will facilitate more informed decision-making. Also, in the future, NMDGF must create a comprehensive management plan supported by sound, peer-reviewed science to justify its management of cougars that outlines goals and objectives, including conserving New Mexico's cougars for future generations.

Because the majority of New Mexicans value and appreciate cougars for their considerable intrinsic, social and economic value, we ask that the agency change course and work to further their conservation instead of facilitating their extirpation. NMDGF must disallow the hounding of cougars—because of the myriad of problems associated with this practice. Outdoor recreation in New Mexico was worth \$2.3 billion in 2021. Of that figure, hunting and trapping amounted to only 0.04% of that spending. It's time for NMDGF to step into the 21st century and work to conserve not dismantle wild nature.

Sincerely yours,

Wendy Keefover

Subject: [EXTERNAL] Official Comments / Statement on new Bear & Cougar rule
Date: Tuesday, July 25, 2023 11:57:54 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To whom it may concern,

My name is Ronald N. Borunda, a lifetime resident of New Mexico and big game hunter since I can remember. I wanted to provide an official statement on the new Bear and Cougar rule that could possibly go into effect soon. If both licenses become available to big game hunters, such as myself, then I will absolutely hop on board and learn everything I need to know to harvest a bear or cougar. Typically, I don't hunt bears or cougars and focus primarily on hooved animals like deer, elk, pronghorn, etc.

However, I've had two (2) encounters over the past 3 years of hunting, where I've called in a bear while hunting elk, during the September bow season. As you can imagine, this was quite scary and both times I wasn't necessarily frightened of the animal but, more of the repercussions if I had to defend myself if the animal had gone on the offense and attacked. Luckily, both instances led to zero action taken on my end as I tried my best not to be seen or heard. With that said, I can't help but wonder, "What If". It's a feeling I would not like to experience anymore because I don't ever intend to break any kind of laws or regulations. I try, and pride myself in being an honest hunter / angler when out in the field. And unfortunately this type of experience would put me in a challenging situation where I am outside the law and would have to plead my case and innocence.

So, I fully support the proposed change and allow big game hunters to harvest bears and cougars during drawn tag hunts or during "season". If granted and given the right to do so, I will gladly purchase tags and follow all rules and laws for bear and cougar hunts. I don't necessarily see this as a "trophy" opportunity but more of an opportunity to harvest while hunting for other species. All while not having to stress and feel like I'm somehow breaking a law for something I really don't have control of; bear or cougar coming in while hunting another species.

I sincerely appreciate you and your staff opening these rule changes to the public. And, I truly hope this passes so I can do what I love, without the worry or stress of possible litigation. Thank you for your time and please consider my witness accounts for the proposed change. This really is a grey area that has flown under the radar for so long now. I'm happy to call myself a hunter / angler from New Mexico again because I now see the efforts your team(s) put forth.

Best Regards,

Ronald N. Borunda

All hunters should be banned from every state, but particularly the ten highest biodiversity endemism states, New Mexico rating number 4. NM Game & Fish is still championing the dark ages when Teddy Roosevelt and friends thought nothing of slaughtering tens-of-hundreds of innocents from Africa to the Amazon. Hunting in the 21st century is one of the greatest of evils, along with consumption of flesh - continued human cannibalism of every guise.

What state agencies charged with "management" of fellow wildlife SHOULD be presenting to its constituencies (the public) are immediate plans to implement medical crisis stations on this burning, hemorrhaging planet with food supplements and misters, and mobile swimming pools, as is done from Israel, to Poland to Madagascar.

To talk about killing and killing and killing in New Mexico is reason enough to boycott every aspect of the infrastructure and sick minds that perpetuate this continuing all-American horror story.

I am writing in opposition to the proposed "bear and cougar rule" which would increase quotas and hunting seasons for bears and the year-round cougar-hunting season.

Please do not implement this new rule. Instead, reconsider and reanalyze appropriate data taking into account the impacts of climate change, habitat loss, the reproductive rate for these large mammals and other factors to redraft a bear and cougar rule that genuinely protects these animals, ensures their long-term viability, and keeps New Mexico wild.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To whom it may concern,

I am writing to you today as a concerned sportsman, hunter, biologist and conservationist urging you to please continue to allow the pursuit and take of predatory animals in New Mexico. Bear and lion hunting, particularly with hounds, is a centuries old method of take, and one that allows careful selection of a target animal before harvest. Few other hunting methods allow you to be as selective of predator harvest as hound hunting, where the age-class, sex, and presence of young can be determined quite easily by being able to get close to your quarry and observe it at length before determining if a harvest is prudent.

By disallowing the hunting of predators you're taking away a vital part of management of all animal species in New Mexico via the North American Conservation model. Contrary to mainstream belief, preservationist tactics are not what America's stunning success of wildlife recovery are founded on. Fair use, recreational harvest with set limits and using ecological and biological surveying tools like tooth annuli analysis and size and weight estimates, coupled with regional harvest data allow for a more accurate survey of predator and all game species than virtually any other method. In addition, the pursuit of game animals is a multi-billion dollar industry across the nation, with lots of that money supporting both local economies and state wildlife agencies through hunter dollars spent in your communities and through excise taxes like the Pittman-Robertson Act.

In short, please support our hunting conservation model and continue the harvest and pursuit of predator species as a means of both recreation, wildlife management, and conservation.

--

Thank you for your time and careful consideration

Sincerely,
Brennan Cusick

Subject: [EXTERNAL] Oppose department's proposed cougar/bear rules
Date: Thursday, September 28, 2023 6:24:10 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Department of Game & Fish:

The proposed cougar (mountain lion) and bear rules for the next four years are completely unacceptable. Not only do they increase allowed permits and/or extend previous increases, but they are a danger to the health and stability of these animal populations. Both cougars and bears are already under grave threat from climate change (drought/wildfires), habitat loss/fragmentation, and motor vehicle collisions.

Your own data on cougars shows how much of an increase there has been in their deaths since 2001.

Average # of cougar deaths per year from 2001/02 season to 2010/11 season = **203.8**

Average # of cougar deaths per year from 2011/12 season to 2020/21 season = **306.1**

Average # of cougar deaths over the past two seasons = **348.5**

We should be seeking to create thriving, healthy populations of cougars and bears in our beautiful state, not making them constant targets. As a result, lower hunting limits should be set for both cougars and bears.

Exactly when is the department going to take into consideration the feelings of those New Mexicans who love all our wildlife, including cougars and bears, but don't feel the need or desire to kill them? When is enough, enough?

Sincerely,

Richard Brown

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico State Game Commission,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and I support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, I believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

I respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

As someone who hunts for bear and cougar every year, I do not want to see this OTC opportunity go away. Even when female limits have been met, hunters should be given the opportunity to continue the hunt for a male.

Respectfully,

Chase Wilbanks.

Subject: [EXTERNAL] Opposing the Bear and Cougar rule
Date: Thursday, August 10, 2023 8:44:57 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I am writing in opposition to the proposed "bear and cougar rule" invoking increased quotas and hunting seasons for bears and the year-round cougar-hunting season.

Not only is the proposed rule based on faulty science and analyses, it ignores the incredible stresses that prey animals are already under from fires, drought, habitat loss, and forage scarcity. It also ignores the collateral effect that killing adult cougars and bears has on their unprotected and unfed progeny. The rule would have a profoundly negative effect on cougar and bear populations and health.

The studies used to justify these hunting increases appear to have cherry picked data to support their case rather than rely upon balanced studies that accurately characterize the health of the target populations.

Please do not implement this new rule. Instead, reconsider and reanalyze appropriate data and make an honest assessment of the impacts of climate change, habitat loss, and other rapidly evolving factors and redraft a bear and cougar rule that genuinely protects these incredible animals and ensures their long-term viability.

Thank you for your consideration,

Dave Kraig

Pojoaque, NM

From: [Marcia Kellam](#)

Subject: [EXTERNAL] Opposing the new proposed NM Game and Fish rule
Date: Tuesday, August 15, 2023 3:44:52 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years. Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time. Killing bears and cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory. Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless and cruel. The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars. NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them. Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited. Moreover, given the newness of these studies, they are only a snapshot of the current population in a given area. We do not yet have long-term on-the-ground field studies of bear and cougar populations throughout the state that could indicate population trends. Absent good data, the department should be exercising great caution with managing the population of bears and cougars. Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for 'trophies' and recreation. Ask NM Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting. 1

Subject: [EXTERNAL] Opposition to proposed rules to increase hunting limits for Bear and Cougar
Date: Tuesday, July 18, 2023 5:44:37 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Members of the New Mexico Game Commission:

In the late 1980s I was the Assistant Attorney General who represented the New Mexico Department of Game and Fish and the Game Commission. Dr. Wayne Evans and James Santiago were wildlife biologists, both of whom the Game and Commission respected. What I learned from the Department's wildlife biologist and from observing the Commission at that time was that hunting limits were annually set based on a true and accurate consideration of the scientific evidence regarding the health of the species' population. The Commission often made difficult decisions to reduce the availability of hunting licenses even when there was public outcry or political pressure to provide more licenses to ever growing numbers of hunters who were not considering the future impacts of hunting that is scientifically unsustainable. The important role of the Commission was to consider the long term impacts its hunting regulations had on the species.

It is my understanding that the national Mountain Lion Foundation, which tracks the health and condition of mountain lion populations throughout the U.S. has found that "New Mexico's hunting quotas far exceed sustainable thresholds established by mountain lion experts and continue to threaten the health and stability of cougars." This is the assessment of New Mexico's cougar population even before the Commission considers further raising the limits on cougars. Accordingly, the Commission should follow the scientific evidence, and pass this year's regulation that reduces the number of cougars licenses issued. In years past, the science of game management was followed routinely by the New Mexico Game and Fish Commission, and hunting was reduced when the science warranted it. Moreover, one need not be a scientist to see the devastating impact that wildfires and sustained drought are having on New Mexico's bear population. Again, the Commission should look at the overall health of New Mexico's bear population in consideration when setting the new regulation; the Commission should reduce, not increase, the numbers of licenses it issues for the hunting of bears.

I respectfully urge this Game and Fish Commission to stay true to the mission of the Game and Fish Department, which is to "conserve" and to "protect" New Mexico's wildlife for future generations of New Mexicans.

Dear Commissioners,

Don't end bear and cougar hunts. The attempt to bridge the divide between trappers and opposing groups has shown that compromise isn't always feasible. Some divisions are too deep to bridge with simple concessions. It's paramount to uphold practices that have long-standing evidence of their effectiveness and necessity.

Sincerely,
Ryan Chandler

Dear Commissioners,

History has shown us that hunters have played an invaluable role in the conservation efforts of regions like New Mexico. Their contributions, both tangible and intangible, have bolstered game populations and fostered a culture of respect for the wild. It's pivotal that we recognize these efforts and ensure that they aren't undermined. Bear and cougar hunts? I'm in full support.

Sincerely,
Luke Tingey

Dear Commissioners,

It's undeniable that hunting plays a significant role in wildlife conservation. From the funds generated through licenses to the active role hunters play in managing and monitoring animal populations, their involvement is essential. Abolishing the use of hounds and general bear and cougar hunting, based on non-scientific arguments, can result in unintended and detrimental consequences to ecosystems.

Sincerely,
Brian Carson

Dear Commissioners,

Keep the bear and cat hunts! It's essential to appreciate that every region has its unique ecological challenges and solutions. Drawing parallels with other states without understanding the underlying dynamics can be misleading. For instance, the consequences faced by states that banned certain hunting practices should serve as valuable lessons. Collaboration and understanding between various stakeholders can lead to informed decisions that are beneficial in the long run.

Sincerely,
Edward Mulvihill

Subject: [EXTERNAL] Our ecosystem depends on Bears & Cougars...
Date: Friday, July 14, 2023 9:47:08 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.

Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures.

Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.

Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless and cruel.

The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates.

Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.

NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.

Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited. Moreover, given the newness of these studies, they are only a snapshot of the current population in a given area. We do not yet have long-term on-the-ground field studies of bear and cougar populations throughout the state that could indicate population trends. Absent good data, the department should be exercising great caution with managing the population of bears and cougars.

Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for 'trophies' and recreation. Ask NM Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.

It is a fact that intelligent, important animals such as these that have been hunted and are on the brink of extinction is

a direct result from these practices. You are catering to Hunting and Wildlife Associations, in addition to creating fear in people to support this cruelty.

It should not be up to humans to control populations of any species. Bears are a highly intelligent animal. I live amongst them and see them on a weekly basis.

We must remember that Animals can live without humans, but humans can not live Without animals, and the earth will not produce without animals such as these.

Protect the cougars and save our Bears for our earth and our children. Not one Bear should ever be killed or harmed. We should worship the ground they walk on.

Please stop using animals for sport and entertainment on the grounds of overpopulation and creating fear. Chasing & Hunting with dogs, and high weaponry is a form of lynching and bullying of the animal and is very unfair and cruel. This is not fair game.

We all need each other on this earth to survive. Please be fair and do what's right for our children. Save the Bears and the Cougars. With all the craziness going on...They are watching us.

Sincerely,
Janice and Kevin Riordan

Subject: [EXTERNAL] PROPOSED BEAR-COUGAR RULES
Date: Wednesday, August 23, 2023 7:44:05 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I was shocked to read in a recent *Sunday Journal* that the NM Department of Game and Fish has proposed raising the kill quota on black bears and cougars from 10% to 25% of those populations and to lengthen the hunting season. It has been suggested that the State's population estimates are not based on sound science or corroborated by independent experts. Both species are ecologically crucial, but populations of almost all species are now under extreme long-term duress from the climate crisis, which will only accelerate.

Also, while it's possible that licensed hunting can limit that harvest, to my knowledge there is no limit on the number of bears that can be euthanized or relocated (which ends often in death) arising from complaints by residents in the wildland-urban-interface. With bird feeders, garbage, water features, fruit trees, and outdoor cooking among other attractants, exurb residents are luring bears into developments at an alarming rate, then calling for DGF to euthanize or relocate "problem bears." This is not the fault of DGF, but of the behaviors and life-styles of residents. However, this unregulated cull is yet another threat to bear populations. At an estimated 18 bears per 100 sq. kms., small local populations can be temporarily wiped out in just a few years. Between 2010 and the present my tiny community exterminated about 26 bears, and only this summer, we have already dispatched two sows and four cubs—30% of the estimated population.

Finally, there is the cruel and unsportsmanlike method of bear and cougar hunts using dogs to tree trophy animals, electronic beacons to find the dogs, then to pick off the exhausted quarry at close range. I understand this violates the principles of fair chase. New Mexico should ban this shameful practice. As just about anyone with enough money can summit Everest these days, anyone with enough technology can bag a cougar or a bear. No intelligence or courage required.

For all these reasons, I strongly object to the proposed 250% increase in kill quota and lengthened season as radically inappropriate. It makes me wonder if New Mexico's wildlife are on the block for tourism and revenue.

Thank you.

To whom it may concern,

I am informed about a campaign to mess up the ecosystem even more by so called "environmental" anti-hunting groups.

While they are very vocal, they seldom go out in nature like hunters, fishermen and land owners do. We care more about the total environment rather than a single issue at hand.

Balance is key and removing a tool like hunting will remove the balance. What happens when there are too many predators?

There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts.

In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars. NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years.

There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them. Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited.

Moreover, given the newness of these studies, they are only a snapshot of the current population in a given area. We do not yet have long-term on-the-ground field studies of bear and cougar populations throughout the state that could indicate population trends. Absent good data, the department should be exercising great caution with managing the population of bears and cougars.

Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for 'trophies' and recreation. Ask NM Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.

**WE MUST PROTECT OUR PRECIOUS ICONIC ESSENTIAL WILDLIFE
ESPECIALLY WOLVES, BEARS AND COUGARS AT ALL COSTS! IT IS TIME TO
CO-EXIST WITH NATURE AND BAN ALL HUNTING/TRAPPING IN OUR STATE.
WE RECEIVE MORE TOURISM DOLLARS FROM KEEPING THESE ESSENTIAL
WILDLIFE ALIVE!**

Subject: [EXTERNAL] Pending Bear and Cougar Rule
Date: Wednesday, August 16, 2023 8:47:30 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To whom it may concern:

It is extremely concerning to hear about the pending rule to outlaw bear and cougar hunting in our state.

Predator hunting, such as bear and cougar hunting, plays a crucial role in wildlife management and maintaining ecosystem balance. By regulating predator populations, it helps prevent overgrazing by herbivores, which can lead to habitat degradation and reduced biodiversity. Outlawing such hunting could lead to increased predator populations, causing imbalances that disrupt the natural food chain.

Unchecked predator populations can lead to declines in prey species, affecting their numbers and distribution. This, in turn, impacts vegetation and alters ecosystems, potentially leading to cascading effects on other wildlife and even human activities such as agriculture.

Landowners might experience increased conflicts with predators, resulting in livestock losses and compromised property security. Moreover, reduced control over predator populations could disrupt delicate coexistence between humans and wildlife.

In summary, responsible predator hunting supports healthy ecosystems by preventing overpopulation and maintaining ecological equilibrium. Outlawing it could trigger negative consequences for biodiversity, habitat health, and human-wildlife interactions. A balanced approach to wildlife management is crucial for the long-term sustainability of both ecosystems and the well-being of human communities.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

If the state is going to have any kind of game management it is imperative that they continue to manage the predator populations at a reasonable level. Additionally, when people begin to move into the habitat of the cougars and bears, the predator attacks on livestock and humans will increase as the have over the years in California. If the hunters don't stand together against the anti-hunters in all areas of hunting, then they will just chip away at our hunting rights until they no longer exist. Stopping managed hunting would very likely result in all of our wildlife disappearing, since there would be no funding to manage the game populations.

Dear New Mexico Department of Game & Fish,

Why are we killing off our native wildlife? The predators are crucial to a balanced ecosystem.

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,

Mountain lions mean so much more to us than being a target — they are a keystone species that other wildlife depends upon and without which New Mexico would certainly lose a significant part of its enchanting charm. For the NMDGF to maintain such high hunting limits on our majestic mountain lions is just plain wrong and totally unacceptable.

Hello New Mexico Game Commission,

Please continue to allow bear and Cougar Hunting in New Mexico.

Please do not allow comments from anti-hunters to persuade you from filling the scientifically driven north American model of wildlife management. Hunting is a conservation and population management tool for the New Mexico Department of Fish and Game to utilize to help manage wildlife populations. Please do not remove this tool from their toolkit. States that have banned bear hunting now spend millions of dollars having government employees kill bears as opposed to the public paying for the opportunity to do the same.

Additionally, since trapping was banned (based on pure emotions) on public land in New Mexico, meso predator populations have increased dramatically and the populations of quail in my area have been drastically reduced. In a similar manner, losing bear and cougar Hunting privileges will likely result in many unattended consequences including reduction of other big game species and an increase in human-bear or human-cougar conflict.

Thanks!
Jaben

Dear New Mexico Department of Game & Fish,

I was shocked today to learn about the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through allowing elk and deer hunters to opportunistically shoot bears and cougars, making unspecified increases to hunting quotas, and lengthening the hunting season for bears in some areas.

Our Department of Game & Fish does not have a good estimate for how many bears and cougars live here and without that information, we must be cautious in how we regulate hunting. Your proposal gives no consideration to the effects our most recent droughts have had on bear food sources and habitat. As you are probably aware, the Southwest is the driest it has been since 800 B.C., making the food and water sources for bears and other animals increasingly difficult to access.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts other animals in danger and risks human safety.

Please reject the bear and cougar rule and instead I urge you to focus on:

- a) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- b) Refraining from increasing the lengths of their hunting seasons.
- c) Prohibiting the use of hounds in bear and cougar hunting.

I cannot for the life of me imagine how this new rule is beneficial in any way except to people who feel they must kill these majestic animals for sport. And the "needs" of those individuals should not govern your policies which are intended to serve the highest good for everyone.

Thank you

Mr. Fox's column provides reasoned answers to my questions about the state's game policy. Who benefits when low-priced hunting licenses are granted to people planning to kill bears and cougars—native animals who struggle to survive in the 21st century? The answer: hunters, many from out of state, and the “guides” who create opportunities for easy kills. These animals don't die to feed people or to protect livestock—they are simply trophies. It's time for the Game and Fish Department to acknowledge its mission: to serve the citizens as stewards of the animals who deserve a chance to live.

Dear New Mexico State Game Commission,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and I support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, I believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

I respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

In addition to the continuation of science based wildlife management, I'd like to voice that lawful bear and cougar hunting is a tradition in my family. It would be a great loss to myself and my loved ones should this opportunity be diminished on grounds other than science based research.

Thank you

Dear Sir or Madam:

I write to ask you not to increase the number of Bear/Cougar licenses in New Mexico or change the rules to allow more hunting. In the last two years I have seen three instances of starving cubs wandering on to ranch lands or other places bordering land where hunting is allowed. Killing females at all--especially if they have cubs--is heinous enough.

I cannot believe that numbers of wildlife are so large as to permit the killing of 864 bears in total and 563 cougars is in any way warranted. Actually it would be better to have them starve than to be shot for "sport". I have personally witnessed hunters using dogs to track bear, which seems an indefensible practice.

I expect you will just dismiss my objections and bow to whatever pressure is coming from hunters but at least wanted to register strong objections.

Sincerely

Sandra Giltner

Subject: [EXTERNAL] Please don't increase the limits on Mountain Lions to hunters.
Date: Sunday, October 15, 2023 6:37:50 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

The mountain lion is a majestic and ecologically important apex predator. Its low birth rates make it to bounce back from low population numbers. There is no food value to killing a mountain lion. It's 100% trophy hunting. Not going off the rails here to suggest a full hunting ban, only asking that the current limits not be changed. With only 3500 left in the wild for the entire state, and no clue to how many die each year of natural causes, this is an animal that could easily drop into endangered territory if over hunted. Please consider leaving the hunting untouched.

Thank you for your consideration,

Mark Margiotta DPM, ACFAS
Albuquerque NM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

- Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.
- Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless and cruel.
- The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The states predator population is already a problem and was even before the trapping ban.

The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences.

California is the perfect example.

One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Thank You!

Please do not increase the bear hunting limits as presented in the proposed Bear and Cougar Rule ([BEAR-AND-COUGAR-RULE-PROPOSED-CHANGES-SUMMARY_2nEd_08032023.pdf \(state.nm.us\)](#)).

The summary of the proposed rules does not include a map of the zones, something that is necessary for understanding the tables included in this summary. No explanation is provided for increasing the limit of animals killed. This is a terribly dry year and our wildlife do not need the added stress of hunters. The kill limits should be reduced for bear and cougar. Let the ecosystem reach its own balance.

Thank you,

Amy C. Lewis

Hello --

I understand you're taking comments about the planned bear and cougar killings.

Charles Fox of Santa Fe wrote an opinion piece in Sunday's Albuquerque Journal. He made some good points, such as ... it's not necessary and it's cruel to chase them down just to give hunters a thrill.

I don't see how anyone can kill a cougar. They're beautiful animals. I don't understand how anyone could just shoot one or why they think they have a moral right to do so. Also, we've had a mama bear and 2 cubs in our yards out here in the East Mountains this summer. We all care about them. I don't understand destroying life so wantonly.

My comment is, please just leave out wildlife alone.

Dear Commissioners,

Balancing the intricacies of wildlife management requires a nuanced approach. In places like New Mexico, the harmony between hunters, game species, and the environment forms a delicate yet resilient ecosystem. Recognizing the historical efforts of hunters in conservation is essential to make informed decisions about the future. Cougar and bear hunting must remain in place.

Sincerely,
Curt Teaster

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

It's crucial to remember the broader context when it comes to wildlife management in New Mexico. The interconnectedness of ecosystems means that decisions made regarding the bear and cougar rule have far-reaching implications. Given this, the science-based insights of experienced biologists should guide us.

I believe in a balanced ecosystem and as a scientist myself, I trust science-based analysis over knee-jerk, emotion-based reactions. Even though I am an avid hunter, if the science says that we need to reduce hunting pressure on certain species, then I am all for it. Conversely, if hunting limits/quotas need to be increased to control populations, I am all for it. I personally will never hunt cats and hate to see them hunted, but I can understand if it is needed since other species such as wolves and grizzlies are missing from our New Mexico ecosystems to balance cougar populations.

Thank you.

Sincerely,
Kimberly Klain

From: [Matt Hagan](#)

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

I trust this email finds you well. I am reaching out to express my support for the continued incorporation of bear and cougar hunting as integral components of New Mexico's comprehensive wildlife management system. I recognize the importance of striking a balance between conservation and sustainable wildlife management, and I believe that responsible hunting can play a constructive role in achieving these goals.

New Mexico boasts a diverse range of ecosystems and an array of wildlife species, which contributes to the unique beauty and ecological significance of the state. However, with the delicate balance of nature in mind, it is imperative that we adopt proactive measures to ensure that wildlife populations remain in equilibrium with their habitats and with each other. Responsible hunting of species such as bears and cougars can contribute positively to this delicate balance in several ways:

Population Regulation: An uncontrolled increase in bear and cougar populations can lead to habitat degradation and an overabundance of these predators. Managed hunting helps maintain appropriate population levels, reducing the strain on resources and promoting a healthier ecosystem.

Species Interaction: The presence of apex predators like bears and cougars has a cascading effect on prey populations and the overall health of the ecosystem. By controlling predator numbers through hunting, we can prevent overgrazing and ensure that the intricate web of species interactions remains intact.

Human-Wildlife Conflict: As urban areas expand into natural habitats, the potential for human-wildlife conflicts increases. Managed hunting can help mitigate these conflicts by keeping predator populations at levels that minimize interactions with people and domestic animals.

Funding for Conservation: Revenue generated from hunting licenses and fees can be directed towards conservation efforts, habitat restoration, and scientific research. These funds provide critical support for maintaining the state's biodiversity and natural heritage.

Cultural and Economic Benefits: Hunting is deeply ingrained in the culture and heritage of New Mexico. Additionally, well-regulated hunting contributes to the local economy through tourism, outdoor recreation, and the businesses associated with these activities.

I understand that implementing a hunting program requires careful planning, scientific research, and robust regulations to ensure the sustainability of both wildlife populations and the natural environment. It is crucial that any hunting activities adhere to ethical practices and

are guided by the best available scientific knowledge.

In advocating for the inclusion of bear and cougar hunting within New Mexico's wildlife management strategy, I encourage a balanced approach that respects the intrinsic value of wildlife while also addressing ecological needs and human safety.

Thank you for your dedication to the preservation of New Mexico's diverse ecosystems. I appreciate your consideration of this viewpoint and the effort you invest in the future of our state's natural resources.

Warm regards,

Sincerely,
Matt Hagan

To whom it may concern:

I am lifelong resident of New Mexico and currently live in Santa Fe.

We need managed predator (bear and cougar) control in New Mexico. Controlled hunting of those species plays a vital role in their management. To discontinue controlled hunting of these predators will have trickle down effects on all other species and will also increase risk of dangerous predator/human interactions.

Continue to allow the professional biologists employed by New Mexico Department of Game Fish manage our wildlife. Please do not give in to special interest groups presenting emotional and non-evidence based arguments.

Respectfully,

Stephen Darmitzel

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

It's undeniable that hunting plays a significant role in wildlife conservation. From the funds generated through licenses to the active role hunters play in managing and monitoring animal populations, their involvement is essential. Abolishing the use of hounds and general bear and cougar hunting, based on non-scientific arguments, can result in unintended and detrimental consequences to ecosystems.

Sincerely,
James Hood

Dear Commissioners,

Let the hunts stay! Recognizing the value of diverse voices in wildlife management discussions is crucial. While every perspective is valid, it's imperative to prioritize decisions grounded in extensive research, historical understanding, and a long-term vision. The contributions of hunters and the expertise of biologists are both invaluable assets in this intricate dialogue.

Sincerely,
Joseph Hauss

To whom it may concern,

As an out of state resident and avid big game hunter I am in favor of continued use of hounds and dogs in the use to pursuit game like cougar and bear. I have a hunt booked in 2024 and have children that can't wait till they get old enough to go with me, so I fully intend to go in the future. Heritage would be lost and so will income from me and the other out of state hunters that spend good money licensing fees, guide fees, hotel and lodging, plane tickets and the whole 9 yards that goes into taking a trip like this from half way around the country. Please take this into consideration.

Comments on 2023 proposed changes to bear and cougar rules:

- I support the continued sustainable consumptive use of all wildlife, including large predators.
- I support the continued use of hounds to hunt bears and lions.
- I applaud the department's efforts to better understand population dynamics of large predators within the state and support the continued study in this area.
- I support all of the proposed changes as outlined by the department during the meeting in Roswell.
- I support separating GMU's 26 & 27 into their own BMZ. I believe this is a unique population of bears that is not closely tied to the greater Gila. Creating a separate BMZ for this area would increase hunter opportunity and better distribute hunting pressure across the landscape.

Thank you for your consideration. -Logan McGarrah

Subject: [EXTERNAL] Proposal for Bear & Cougar Hunts
Date: Friday, July 14, 2023 2:25:49 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To Whom it May Concern,

I am writing regarding the proposal to hunt bears and cougars for the next four years. Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years. The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. In addition, there has been no external review of those population estimates by independent outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars. It is because of this and many other reasons that I ask that you reevaluate the proposal and request the lowering or elimination of these hunts.

Thank you for your attention in this matter!

Subject: [EXTERNAL] Proposal re: hunting of bears and cougars
Date: Friday, July 14, 2023 1:19:45 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To the NM Game Commission,

I am writing you to share my concerns with your draft proposed rule that governs the hunting of bears and cougars in NM for the next four years.

Have you accounted for the severe drought and wildfires, both of which will most certainly be continuing and intensifying, in your habitat and/or population estimates? It seems more reasonable to lower the kill quotas with these serious conditions, not raise them.

Have there been any external reviews of the population estimates? Independent, outside experts need to weigh in to give any credit to the figures you use. Is there a management plan?

The manner in which these animals are hunted and killed (i.e. using dogs to tree them and then shooting the exhausted animals at point blank range) is cruel and inhumane...most people do not support this kind of "hunting" which simple surveys will show. Please adopt hunting rules that ban the use of dogs in the hunting of bears and cougars.

Bears and cougars are top (apex) predators who are extremely important to the health of our ecosystems. Since both species self-regulate their own numbers, erring on the side of killing fewer animals is not a problem, but killing too many will impact their populations for a very long time.

Thank you,

Subject: [EXTERNAL] Proposal to extend hunting limits on mountain lions
Date: Wednesday, October 25, 2023 12:18:45 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

This new proposal by the New Mexico Department of Game & Fish is a dreadful one. Clearly they have been listening to the ranchers whose agenda has always been to decimate the predators in our state. This is an age old fight that does not deserve the attention or demands that it has always engendered. I hope that the NMDGF can be reminded that they need to protect and preserve the wildlife in our state as seriously as they do the “meat producers”. They squawk incessantly but that should not add weight to their demands.

I hope that this proposal is discarded as it should be.

Janene M, Habers
Bernalillo, NM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To whom it may concern:

This proposal is outrageous!

Are the hunters hunting for food? Are they going to eat the bears and cougars?

If not, then leave them alone.

This proposal should not be considered at all. All of you need to read Dan Flores' book, Wild America. He talks about the wholesale slaughter of America and how the needless killing of wildlife upsets nature's balance.

It is so wrong to willfully slaughter animals for fun, or to prove their 'manhood.'

The hunting already legal is entirely too generous as it is. Shame on all of you for even thinking of raising or suggesting to raise the limits. If ranchers are complaining about cougars attacking their herds, then tell them to go into another line of business: Wildlife conservation!

Thanks

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I am opposed to any increases in harvest of bears and cougars. I live in the Jemez mountains and have only seen one bear plus one cougar in 15 years. These animals are losing their habitat at alarming rate and harvesting should be reduced, not increased. They should definitely not be killed by deer hunters. That is not fair at all.

I thought with the democrats in power, this assault on wildlife would abate. But no, you want to kill more. It is truly disgusting what you are planning and I don't support the increases.

From: [Jeffry Hanus](#)
To: [DGF-Bear-Cougar-Rules](#)
Subject: [EXTERNAL] Proposed Bear and Cougar Hunting Rules
Date: Friday, July 28, 2023 3:33:33 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear NM Department of Game and Fish Game Commission:

My name is Jeffry Hanus. Raising kill quotas for bears, extending the bear hunting season and "adjusting" kill quotas for cougars is a terrible idea for many reasons, including the following:

Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for 'trophies' and recreation. NM Game and Fish needs to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.

Given the uncertainty of habitat and population estimates of both bears and cougars, the **quotas for both should be reduced**, not raised. Kill quotas for both species have been unjustifiably high for many years.

Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.

Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.

The hunting proposals lack scientific validity. There is no management plan detailing measurable objectives for these species, and no attempt to address the

uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in these hunting rules proposed for bears and cougars.

NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.

Thank you for reading my comments. If you have any questions, or would like to discuss this in person with me, I have included my phone number below.

Jeffrey Hanus

Subject: [EXTERNAL] Proposed Bear and Cougar Rule
Date: Saturday, August 5, 2023 4:55:09 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

As a resident of NM, I wish to register my opposition to the proposed rule. I think it's outrageous that you would make this proposal without a firm grasp of how many there actually are in NM. Recent wildfires, drought, and the general effects of climate change may well have taken/be taking an alarming toll on these creatures. The game department's primary focus should be on preserving these wildlife resources for the benefit of the general population and future generations—not creating opportunities for a small number of hunters (so-called "sportsmen") to decimate those resources. People don't hunt bear and cougar for sustenance. They do it solely to gain the right to brag about their ill-gotten trophies. I know hunting provides income to the Game & Fish, but the measly \$40+ license fees hardly compare to the taxpayer dollars that go toward supporting your agency.

Please do not move forward with this proposal.

Dear NMGF

I would like to comment my opinions on the proposed rules for bear and cougar.

First of all on the cougar, I would love to see in the future that trapping for cougars would be legal again in our lower elevation/plains areas, like units 32, 31, 40 and 39 and such like. Due to our drier conditions it is extremely hard to harvest the amount of lions, by use of hounds, that need harvested to keep ranchers from having calves killed and to help keep them from knocking the deer numbers so bad.

On the bear glad to see all the dept is doing for the bear population. I would just like to caution that we don't allow too high of harvest rates and decline our trophy size bear population too badly.

Bear and Cougar hunting with hounds is definitely the most strenuous hunting I've ever done. The picture the anti-hunters like to paint is so wrong and off. We hound hunters have the ability to better field judge a bear or lion by treeing it as well. Instead of looking at it with binos from a half mile away and such. Therefore we can harvest more older mature animals.

Thankyou for your time and all you do for New Mexico and it's wildlife.

Sincerely Cole Burns

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Below please find the stated Mission of the New Mexico Department of Game and Fish as it appears on the Department's website:

"It is our mission "To conserve, regulate, propagate and protect the wildlife and fish within the state of New Mexico using a flexible management system that ensures sustainable use for public food supply, recreation and safety; and to provide for off-highway motor vehicle recreation that recognizes cultural, historic, and resource values while ensuring public safety."

Note that "to conserve" wildlife and fish is the first stated mission of the Department. In the middle of a summer drought caused by global climate change and just after a couple of the largest most devastating wildfires in the recorded history of New Mexico, the Department proposes based upon completely inadequate data to increase trophy hunt quotas for two of our apex predators - cougars and bears. In other words at a time when their current populations are most vulnerable.

It is common knowledge among scientists that biodiversity is crashing globally due to habitat loss, global climate change, environmental pollution and other anthropogenic factors. New Mexico remains one of the few relatively sparsely populated regions with a diverse and spectacular environmental heritage.

I urge the Department to withdraw their proposed ruling, which is at odds with the Department's mission to protect and conserve New Mexico's unique wild natural heritage.

Dear Commissioners,

As a proud hunter and conservationist, thank you for the opportunity to comment on the Bear and Cougar rulemaking.

The proposed bear and cougar rulemaking generally demonstrates responsible and sustainable management of bears and cougars, while maintaining high levels of opportunity for hunters. I believe that sound science-based conservation involving hunting as the primary management tool, while maximizing opportunities for all huntable species, including carnivores such as bears and cougars, is necessary to the long-term health of wildlife. Hunters have long paid the way for conservation, both game and non-game wildlife, and maximizing opportunity for hunting is also key to long-term funding for all conservation. Hunting benefits wildlife conservation.

Please stand on the side of hunting and conservation and accept the recommendations of the Department's wildlife professionals on bear and cougar rulemaking. Thank you for the opportunity to comment on this important issue. SCI is always First for Hunters!

Dear Commissioners,

As a proud hunter and conservationist, thank you for the opportunity to comment on the Bear and Cougar rulemaking.

The proposed bear and cougar rulemaking generally demonstrates responsible and sustainable management of bears and cougars, while maintaining high levels of opportunity for hunters. I believe that sound science-based conservation involving hunting as the primary management tool, while maximizing opportunities for all huntable species, including carnivores such as bears and cougars, is necessary to the long-term health of wildlife. Hunters have long paid the way for conservation, both game and non-game wildlife, and maximizing opportunity for hunting is also key to long-term funding for all conservation. Hunting benefits wildlife conservation.

Please stand on the side of hunting and conservation and accept the recommendations of the Department's wildlife professionals on bear and cougar rulemaking. Thank you for the opportunity to comment on this important issue. SCI is always First for Hunters!

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

NM Fish and Game is a department owned by the people of New Mexico, Your primary charge is to protect the wild animals of our state. You have a terrible reputation for taking care of our animals. This proposed increase in bear and cougar kills is just another sad chapter in your history. This won't make you much money and it will absolutely damage our bear and cougar families. Your training should tell you this is very destructive.
Publish your data that supports this proposal..
Tucker and Donna Haltom

I want hunting quotas and seasons reduced, and NOT increased. Living predators are better environmentally and are a draw to our state. Trophy hunting is old and outmoded and I know some anachronistic people enjoy it, but it is cruel and selfish. It is time to join modern times and enjoy our wildlife alive and not slaughter it.

Thank you for considering my views.

Subject: [EXTERNAL] Proposed Changes in Bear and Cougar Game Limits
Date: Monday, July 31, 2023 3:27:17 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I am opposed to the changes that increase the number of bears and cougars that could be killed for game purposes. These are relatively rare animals, especially the cougars, whose habitats are already under stress from encroachment by civilization. I believe that increasing the limits on numbers available for game hunters is irresponsible in the light of the fact that these proposals are made without a documentation of the existing numbers in cougars. These are resources that are in the public trust and should not be used for the entertainment of a very small number of hunters at the expense of the public of New Mexico.

L.S.Crumpler

Subject: [EXTERNAL] Proposed Hunting Plan for Cougars
Date: Sunday, October 22, 2023 1:47:53 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To Whom It May Concern:

I read about your proposal to extend hunting limits on mountain lions/cougars (October 15, Albuquerque Journal). Under current limits, hunting amounts to about 10% of cougar deaths. Isn't this enough where the cougar population in the entire State is only about 3500? Extending the limits for the pleasure of hunters is unfair when cougars and other animals are further imperiled by changing climate, disease, wildfires, and attacks from other animals. We all know that hunters maintain a formidable lobby in local and State politics, but the rest of us have interests in New Mexico wildlife, too. Please hear US on this issue and act in the best interest of the cougars by NOT extending hunting limits. Thank You

Respectfully,
Sali Evans

Subject: [EXTERNAL] Proposed Hunting Quotas for the 2023/24 Season
Date: Thursday, August 24, 2023 7:47:11 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To Whom it May Concern,

I am as a frequent visitor of New Mexico, who travels there for the specific purpose of wildlife watching, to express my concern and disappointment at the expansive proposed hunting quotas for bear and cougar. These numbers must be informed my science and at present they risk undermining the health of the greater ecosystem as a whole. I would strongly ask that you reconsider and lower these limits to protect these populations for the long term, and avoid any expensive and protracted law suit that will no doubt follow from inadequately considered estimates.

Thank you for your time,
Ann

Subject: [EXTERNAL] Proposed Hunting of Cougars & Bears in NM
Date: Friday, August 25, 2023 9:25:26 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To whom it concerns on the NM Gaming Commission:

I am a lifelong NM resident and I am writing to voice my opposition to the proposed plans to allow hunting of more cougars and bears.

I am very concerned in the climate crisis we are experiencing that the proposed kill quotas for both bears and cougars cannot be scientifically justified. How the quotas were determined is not very well studied and unclear how the results were determined at best. No consideration has been made for rising temperatures, extreme drought, or habitat loss from catastrophic fire.

Bears and cougars both evolved to be self regulating. There are not too many. But over-hunting can cause them serious harm and damage.

Please oppose this plan for more quotas on killing these wild animals

Regards

Gregory Sandoval

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

In a Albuquerque Journal article on Sunday 7/30/23 there was an article of paying hunters to chase/scare bears and cougars up trees and then shoot them. The practice is wrong, inhumane, and unethical. Bears and cougars take care of their numbers.

A cougar was mentioned in the Albuquerque Journal on Tuesday, 8/2/23 about a cougar spotted by a sliding glass door home in Rio Rancho. The cougar was tranquilized with a dart by the New Mexico Department of Game and Fish along with Animal Control and taken away to a less populated area. Why can't a more humane solution like this be performed more often?

Subject: [EXTERNAL] Proposed Rule Change Bear/Cougars
Date: Thursday, August 24, 2023 9:18:05 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

As a New Mexico resident and business owner, I am writing to express my opposition to a proposed change in kill quotas and extension of the hunting season in the state. I understand that comments are being accepted and a final vote will occur later this year in Farmington. The Dept of Fish and Game has not submitted a thorough evaluation of the current population of the wildlife targeted, bears and cougars which are difficult to count. Data required to make a sound conclusion is available in limited areas of the state when an extensive survey is required maintaining strict scientific protocol.

Wildlife is a public trust and the trustee has a duty to protect and manage the asset for all beneficiaries not just trophy hunters and the gun lobby. The Dept of Game & Fish must recognize the inherent value of a species to live without having to meet the needs of some entity. If broad public opinion were considered this rule change proposal would not be entertained yet the pleas and desires of the public are ignored by wildlife agencies.

The hunting of bears and cougars using dogs, sometimes radio collared, is not true hunting and such barbaric "hunting" methods should be outlawed. Chasing a bear or cougar to exhaustion then shooting it out of a tree, point blank is horrific and cruel. Such killing for trophy and sport recreation is reckless and disrupts the social structure of bears and cougars and other wildlife. Young are left to starve when their provider is slaughtered.

Due to the continuing changes to our environment with more extreme heat and drought, it is impossible to believe that population of bears and cougars has increased and hence raise the kill limit and extend the hunting period. A much more conservative figure should be established and the modality used must be transparent. A lower quota must be set for bears and cougars due to our climate trends and frequent wildfires. The number of hunting permits issued should not be increased as it is not warranted based on the flimsy accounting that is not transparent. The hunting season should not be extended allowing more wildlife to be killed in the summer months. With the existence of healthy populations remaining unestablished it is imperative that a conservative quota be maintained regarding wildlife, bears and cougars.

Date: Wednesday, July 19, 2023 5:50:42 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Hi

I believe there are 4 changes that are being proposed for 2024-2028.

Bear: I am fully in support of increasing the harvest numbers in the proposed zones. I also support disbanding zone 7.

Cougars: I support going to the actual limit number for the female sub-limit. I do believe that all cougar pelts need to be tagged. I Do Not support the use of elk or deer tags to harvest a cougar or bear in any circumstance. They should have to purchase an additional game specific tag. I Do Not want units disclosed for cougar harvests like it was in the past on the harvest report. The harvest report is good the way it is.

I would like to propose that all game meat for bear and cougar has to be taken out of the field.

Thank you

Date: Friday, October 20, 2023 4:13:10 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I wrote comments on the proposed rule previously, however remain concerned that this amended rule continues to not address the miles of bear and lion habitat lost to fires in New Mexico last year, particularly in the Pecos Wilderness and Santa Fe and Carson National Forests. Those units should be completely dropped from bear and lion hunts until new population studies are conducted and new data analyzed regarding the approx. number of animals using this habitat and the health and reproductive success of those animals within and adjacent to recent burn areas.

We continue to be concerned regarding the high quotas being proposed for bear and lion in New Mexico, and the lack of recent population studies to support these high numbers. Like many New Mexicans- we urge the Dept. to withdraw the current proposed and amended rule and develop a rule after new data is collected and analyzed and peer reviewed, and to truly manage out state's wildlife populations in a sustainable way, based on sound data and emphasis on the future - taking into consideration a changing climate, ecosystems, and increasing large wildfires.

Thank you and hope you will listen to the concerns of the public this time and to sound wildlife science.

Dear New Mexico State Game Commission,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and I support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, I believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

I respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,

Justin Park

To whom it may concern:

I was born and raised here in New Mexico. I live in Los Alamos and I have a black bear in my backyard often and a cougar killed a deer about three houses away. I do not believe the department's proposed increase of hunting quotas will do anything to reduce human and animal friction. Sounds to me like somebody's pockets are getting lined. The use of dogs for hunting is not only cruel and unfair to the wild animal, it shows that the hunters are incompetent. And not able to do it on their own. I believe the surveys that the department claims shows increased number of these animals are tainted and unreliable. We have these animals more in town now because we have had tremendous, out of control wildfires in the mountains, in our case the Jemez Mountains, that have destroyed the food for the bears and the cougars and also they are desperate for water. The fires have destroyed our mountains and these animals' habitats. The so-called survey does not account for these results, and I bet there are less bears and cougars now than there were since before the fires. I am absolutely against any increase in hunting quotas and all trapping and use of dogs to hunt should be prohibited as anachronistic and cruel activities, the same as dog fighting and cockfighting. It's time to eliminate these useless and damaging activities of a few people who want to kill animals. Hunting by out of states should be prohibited or severely restricted. Eco tourism is New Mexico's future, and primitive hunting behavior is its past. I am not against all hunting, such as hunting deer and elk for food on the table, but hunting of apex predators is ridiculous. My voting and my support for candidates will reflect my views. Thank you.

Hello,

I am a life long resident of the state of New Mexico. I am an outdoorsman who loves to hunt and fish.

Every animal I have ever taken fed my family and friends.

I am 100% opposed to hunting animals for sport or because they are on land which the, ever increasing, human "civilized" communities are now encroaching.

Hunting these animals into extinction over the next few generations is the most likely outcome of these sorts of proposals.

It's a sad day when we are even considering this in our state.

I would love to discuss options and ideas other than destroying these animals

Best regards,

Jon Priest

let the the NM Game biologists and daily users (hunters, ranchers, farmers) drive and make changes to the proposed revision in hunting bears and cougars. The active hunting and use of hound in tracking and trailing of bears and cougars keeps a respectful balance between human wildlife interactions. When this balance is removed completely certain wildlife populations then set new habitat boundaries in urban areas leading to increased wildlife conflict. Again leave the decisions to the active wildlife biologists and users (hunters ranchers farmers) that know the real situation the best.

Subject: [EXTERNAL] Proposed legislation
Date: Thursday, July 20, 2023 11:14:02 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Greetings,

My comments are directed at the proposed changes to the DGF's policy for Bear and Cougar management here in New Mexico.

I know that you all have a big job to do in helping balance out the co-existence of people and animals (wildlife) here in our state. I must, however, ask that at this time, the proposed increases in zone areas, kill limits ("harvest" as in the legislation) numbers of hunters, and timing of season closures, be suspended.

Firstly, our state is suffering so much now with the drought and subsequent wildfires. We are all suffering - humans and animals alike. Opening up the field for more killing at this very vulnerable time has so many consequences; including the aftereffect of a decline in the species altogether if they lose more of their populations.

I know that cubs, kittens and obvious mothers of those are "off limits" to kill, but a hunting dog will not know the difference, and I also know that once a person has in mind to kill something, they will likely kill it. Adrenalin is a powerful drug. So is stress and frustration...

Working as a therapist in the corrections industry, I'm very aware of the atmosphere of violence in our Nation - I'm immersed in it every day. We see the manifestation of violence as directly related to anger, stress, and frustration; issues we are all dealing with more and more these days, and it frightens me to see policies that encourage and allow more killing. I don't eat animals, but I respect those who ethically hunt and feed their families, teaching their children about respect and ethics at the same time. Hunting for "sport" is not the same. To me, as a therapist, it is an expression of dominance in service of ego, anger, frustration, misinformation, and lack of respect for life itself. I know it's never going to stop, but keeping limits on this activity is a way to at least keep things in perspective. We witnessed what happens when this process fails a year and a half ago with the wolf slaughter in Wisconsin.

Our government agencies can be beacons of restraint, respect, compassion, and co-existence. We desperately need role models for these behaviors and mindsets. The DGF is a strong agency that inherently already models practices of intelligent and respectful management between ourselves and our wild neighbors. I urge you to continue to be this beacon of restraint and

respect for the welfare of us all.

Thank you very much for reading and considering my thoughts.

Warm Regards,

Colleen D., Licensed Mental Health Counselor, newspaper columnist, artist, writer, educator, animal welfare volunteer.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To Whom It May Concern:

I read the article in the Albuquerque Journal by Charles Fox, in which it says the State Game and Fish Department wants to increase the number of cougars and bears that can be killed in hunting. The headline "unethical and unscientific" perfectly summarizes this proposed action.

On what basis is this increase proposed? Is there a dangerous overpopulation of either animal? Has there been some sort of survey done? It does not seem that there has been. The writer of this article makes a very accurate statement: The game department does not own the state's wildlife. So what are the reasons for this proposed increase? Are we to host increased numbers of hunters, many from out of state, who just want to kill something and mount the head on their wall?

I understand the need for controlled hunting of species such as deer and elk, which if allowed to overpopulate can become subject to disease and starvation. What is the rationale for killing more bear and cougar? Do they not control themselves through the availability of food and habitat?

More importantly, does the department have any idea of the population of bear and cougar? If so, this fact should be made public. Otherwise, the motivation for this increase seems to be a focus on hunting and killing and not on the proper balance of our wildlife. We as citizens of this state all have a right to have these animals present in our state. And the method of the "sport" described in the article is most certainly cruel and unjust and in no way fits the definition of true hunting. The hunters I know pursue their deer or elk in a sportsmanlike way, and then plan to eat their prey. I doubt the hunters of bear and cougar plan to consume their kill. They just want to kill something.

I am planning to message the governor as well. There needs to be better balance on the State Game and Fish Department between hunting and conservation. I hope the department

considers
their proposal after more careful thought and definitely after assessing the population of bears
and
cougars. I am also contacting friends in New Mexico who should be aware of this drastic
proposal.

Thank you.

Date: Friday, July 21, 2023 12:36:26 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

This undersigned and her husband are opposed to increasing the kill quotas for bears, extending the bear hunting season and adjusting kill quotas for cougars. The proposed rule mentions how population data was compiled, but does this data give any more than a snapshot in time? There is no reliable information available to the public concerning what the populations of bears and cougars are and what the objectives are for these species. Furthermore, there has apparently been no external review of the population estimates by independent, outside experts. There is also no mention of climate trends which include severe drought and wildfires which would likely indicate that kill quotas should be decreased, not increased.

Both species are top predators crucial to the health of our ecosystem. Because they regulate their own population numbers, killing fewer of these animals is not problematic. However, If too many are killed, their populations could be negatively impacted for a very long time.

It seems as if the proposed rule changes which will add more bear hunting permits and will start the season earlier is motivated by a desire to appease hunters. Yet, it is my understanding that these species are generally hunted using dogs who chase them until they climb a tree for rest. When the hunter arrives at the scene, having found their dogs by using electronic collar beacons, the hunter shoots the animal at point blank range. Where is the sport in that? My husband, who was an active hunter for many years, thinks this practice is contrary to Fair Chase hunting principles. It is abhorrent to many New Mexicans that bears and cougars are killed in this manner only for trophies or recreation.

Please do not adopt the proposed rule and if a modified version is proposed, please provide more specific and credible data to justify increasing kill limits.

Sincerely,

Jaclyn Sinclair

Subject: [EXTERNAL] Proposed rule...Public comment.
Date: Sunday, August 6, 2023 11:36:31 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I am writing to express my strong opposition to the proposal of raising the kill quotas for bears and cougars in New Mexico. As a concerned citizen and a lover of wildlife, I firmly believe that such a decision would have detrimental consequences on our local ecosystems, biodiversity, and the overall balance of nature.

Bears and cougars are essential apex predators that play a crucial role in maintaining the ecological equilibrium of our region. By regulating prey populations, these magnificent animals help control disease outbreaks and prevent overgrazing of vegetation, which in turn benefits a multitude of other species in the food chain. Increasing the kill quotas would disrupt this delicate balance, leading to potential ecological imbalances and cascading effects on our natural environment.

Furthermore, these majestic creatures contribute significantly to our state's cultural heritage and draw ecotourism, providing an economic boost to local communities. Many tourists and nature enthusiasts visit New Mexico specifically to catch a glimpse of these iconic animals in their natural habitats. By increasing the kill quotas, we risk diminishing the chances of encountering these creatures in the wild, which may negatively impact tourism revenue and local businesses dependent on wildlife-related activities.

It is essential to remember that non-lethal methods of wildlife management exist and should be prioritized over lethal control whenever possible. Promoting coexistence and implementing proactive measures, such as public education about living safely alongside wildlife, deploying deterrents, and enhancing habitat preservation, can be more effective in mitigating human-wildlife conflicts without resorting to lethal measures.

I urge the New Mexico Department of Game and Fish to explore alternatives that foster harmonious coexistence between humans and wildlife while promoting conservation efforts. There is no management plan detailing measurable objectives for these species and it is nearly impossible to accurately measure current populations. Adding more hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless, cruel and short sighted.

In conclusion, I respectfully request that you carefully reconsider the proposal to raise the kill quotas for bears and cougars. It is important that we protect and preserve the rich biodiversity of New Mexico for the benefit of present and future generations.

Thank you for your attention to this matter.

Hi Folks,

I recently became aware of the proposed rule changes regarding the increase in issuance of licenses to take bears and cougars. An article in the Albuquerque Journal dated July 30th, 2023 by Mr Charles Fox of Santa Fe very lucidly described the rule changes and his opposition to any increase in harvesting of these animals.

I am, or really was, a hunter for 70 years and have hunted big and small game in East Africa, India, Nepal and here in the US especially New Mexico for elk. Time has started to wear me down physically, but I still consider myself a hunter.

Having said that, I agree totally with Mr Fox's article in the paper. Frankly, I have issues with harvesting bears and cougars at all. For what purpose? Just to be able to kill an animal? With elk and deer, etc, the animal is put to good use in the form of food. But that is not a valid reason to kill a bear or a cougar.

If the rules were changed due to animal population control or for safety reasons, then I can understand the taking of a bear or cougar. But only for these reasons.

I suggest you re-read Mr. Fox's letter as he summarizes the issue very well. I have pasted a copy below.

In summary, I oppose any increase in the harvesting of bears and cougars, and in fact, would support the reduction of the number of licenses issued

**Proposed rule authorizing killing of bears and
cougars is unethical and unscientific**

The New Mexico Department of Game & Fish authorizes the killing of an estimated 10% of the state's bears and cougars every year without actually knowing how many there are. This policy is highly questionable, but now the game department wants to kill up to a quarter of our bears and cougars every year without any coherent reason. This is a reckless and destructive proposal lacking scientific rigor and ethical competence. The game department's continuing focus on expanding the recreational killing of our wildlife is another clear example of why state wildlife management must be reformed and modernized.

Bears and cougars are both native to New Mexico and belong on this landscape in ecologically significant numbers. These species manage their own populations based on the availability of food and habitat. There is no credible evidence that either species needs to be lethally "managed."

Autumn in New Mexico is one of the best times to enjoy our natural areas. But anyone who has been in the forest when hunters are chasing bears or cougars with packs of dogs knows how chaotic it is. Radio-collared hunting dogs pursue bears and cougars for miles. Nursing mothers and young are especially vulnerable. Exhausted and badly outnumbered, bears and cougars will climb trees to try to escape.

Hunters then shoot the animals at point-blank range in what is essentially an execution-style killing. This is unsportsmanlike behavior that violates the most basic hunter ethic of "fair chase," an ethic the game department claims to uphold. Hypocrisy makes a poor foundation for any public policy.

The game department does not own the state's wildlife. Wildlife is a public trust in which everyone holds a legitimate interest, not just those who destroy it or encourage its destruction. The vast majority of New Mexicans do not hunt or fish but have essentially no say in wildlife policy. The game department is supposed to be the keeper of the wildlife public trust but in this duty,

it fails miserably, selling off the state's wildlife as "products" on its website, charging just \$47 to kill a bear and \$43 to kill a cougar.

New Mexico should not be managed as a pay-to-shoot game farm. State wildlife policy should reflect our values as a society. Social attitudes toward wildlife have evolved enormously over the past century. We are largely a mutualistic society now, which means live and let live in some manner of respectful coexistence.

It's difficult to justify the continued recreational killing of wildlife in an age of mass extinctions, megafires, and persistent drought. We need a state wildlife agency whose mission is genuine conservation, whose methods are humane, and whose agency culture reflects a deep appreciation for the value of a unique, vulnerable, and dwindling public asset.

Please speak up on behalf of our state's bears and cougars. The New Mexico

Department of Game & Fish is currently accepting comments on the proposed bear and cougar rule. Email: DGF-Bear-Cougar-Rules@state.nm.us.

A juvenile New Mexico black bear is seen in the Manzano Mountains in Albuquerque. The New Mexico Department of Game & Fish is proposing a new rule regarding harvest limits, zone boundaries and season start dates.

Dear Agency Representatives:

I am saddened and distressed to hear that your agency is considering raising kill quotas for bears and cougars and to prolong the trophy hunting season . I urge you to reconsider these policies. As you know these animals are already suffering due to habitat loss, drought, and wildfires.

I have never understood why your agency is not in the business of protecting wildlife, rather than figuring out more ways to kill and create suffering . This is wrong, it is just wrong. It is 18th & 19th century thinking , where destroying predators was done in egregious numbers.

Please - come into the 21st century with your policies. It is way past time to make some better changes. Surely you understand that predators are necessary to our ecosystem, that's just basic good 'management' .

Thank you for your attention,

Hildegard Adams

Subject: [EXTERNAL] Protect Bears and Cougars in New Mexico FROM INCREASED KILL QUOTAS
Date: Saturday, July 29, 2023 1:07:43 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Please consider protecting our ecosystem and our wildlife in New Mexico by refraining from increasing kill quotas.

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be **reduced, not raised**. Kill quotas for both species have been unjustifiably high for many years.

Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their population for a long time.

New Mexico has recently experienced **severe drought and wildfires**, both of which will almost certainly continue and intensify into the next four years. There is no indication the New Mexico Game and Fish has accounted for these factors in their habitat or population estimates. **Our climate trends weigh in favor of lowering kill quotas, not raising them.**

As an educator and lover of our precious wildlife & ecosystems, I am asking the NM Game and Fish NOT to increase kill quotas for bears and cougars. My middle school history students will be conducting a project in August on these topics and the significance of these wild animals to indigenous communities in our beautiful state.

Thank you for your consideration.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Sir or Madam,

Please protect the hunting of bear and cougar by dogs. We need to protect the deer and elk populations for our future generations. When these predators go unchecked it's sure to ruin the wildlife population that many of us New Mexicans depend on year after year. I strongly oppose any rule change or legislation that limits the hunting of these dangerous predators.

Thank you,

Asher Vigil

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

- **Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised.** Kill quotas for both species have been unjustifiably high for many years.
- Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.
- Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.
- Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless and cruel.
- The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.
- NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.

- Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited. Moreover, given the newness of these studies, they are only a snapshot of the current population in a given area. We do not yet have long-term on-the-ground field studies of bear and cougar populations throughout the state that could indicate population trends. Absent good data, the department should be exercising great caution with managing the population of bears and cougars.
- Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for ‘trophy’ and recreation. Ask NM Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.

Thank you.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Officials,

I write to strongly urge you to protect our precious iconic essential wildlife at all costs. We must co-exist with nature. Please use NON lethal methods to manage wildlife!

Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans. Our state's wildlife deserves better. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Subject: [EXTERNAL] Public Comment on Draft Proposal
Date: Sunday, July 30, 2023 4:37:27 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To Whom It May Concern:

The very idea that hunting cougars and bears could be deemed an "opportunity" is abhorrent. Including such language in a draft proposal codifies that approach as reasonable. It isn't.

The draft proposal released to the public for comment is a nearly masterful exercise in squaring a circle. New Mexico Game & Fish (NMG&F) is basically claiming to generate "advanced" models, based on ambiguous kill data, derived from those who would happily kill every four-legged creature on national forest land. In so doing, the agency is basically saying, 'we (NMG&F) control the data from which we generate models, from which our data generates a self fulfilling prophecy (that 'there will always be four-legged things for us to shoot at, because we're so clever at "managing" it'), whereby we never have to question anything we do, or have it corroborated by parties who don't have a conflict of interest.'

Increasing the number of apex predators (both bear and cougar, from this draft proposal) to be killed, as a sadistic form of 'fun,' based on the self-reported "data" of those who would (and often do) kill any living creature, (with or without the imperceptive oversight of NMG&F) is irresponsible.

Those predators, when left to their own devices, eschew contact with people, and get on with the job of keeping the elk and deer (so prized by said sadists for wall hangings) populations healthy, in a way NMG&F doesn't even try to. In turn, this helps keep the ecology of the forests they inhabit healthy, and keeps trees alive and rivers flowing. NMG&F doesn't even pretend to have such in their purview/mandate. And the best bit is that they do it for free. You certainly can't say that about the bureaucratic behemoth that is NMG&F.

When your primary goal as an agency is to encourage a small, twisted subset of the human population to revert to neanderthal behavior with 'advanced' killing tools, your role is superfluous. The agency is an anachronism.

There is no demonstrable reason to kill a bear or cougar in this day and age. No one could claim to need the meat. Hunting is not a pauper's prerogative; much as NMG&F tries to romanticize it as such. You need a lot of money to buy a gun, ammunition, (the now ubiquitous Elmer Fudd ATV), and fuel for it and the truck and trailer you haul it into the woods

on. And I've never met a hunter that didn't stock up on alcohol and food to take hunting. Being a sod with enmity towards nature takes provisions, it would seem.

I reject the notions proposed in this draft proposal, on the grounds that they are based on hazy data, provided by individuals with a conflict of interest. Bearing in mind that it took Roxy's Law to stop NMG&F from encouraging the public on the decals on their official vehicles, to use irresponsible, cruel traps and poisons with impunity, should highlight how wasteful NMG&F is.

I am happy to go on the record and propose the dissolution of the New Mexico Game & Fish. It has proven itself to be the very model of corruption & bureaucracy in its dealings with the public, and its mismanagement of public wildlife. Big government run amok, if you will. The very idea of relying on individuals to 'report' truthfully to NMG&F (the staff of which make up a rather large block of hunters in the state) is absurd. Further, the idea that their 'reporting' is used as a basis for death modeling should frighten anyone with a natural or unnatural fear of AI being put to negative use.

The draft proposal claims that relevant data, (used as the basis for questionable modeling) will be "post[ed]" and that the draft proposal will change over time. Clarity is certainly called for. Either it's a final draft proposal, or the agency is trying to take the piss with the public. This is a disingenuous way to engage with the public, and comes across as *not in good faith*. A phrase that one could argue is the actual motto of NMG&F.

Sincerely,
April Lee

Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.
- Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless and cruel.
- The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.
- NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill

quotas, not raising them.

- Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited. Moreover, given the newness of these studies, they are only a snapshot of the current population in a given area. We do not yet have long-term on-the-ground field studies of bear and cougar populations throughout the state that could indicate population trends. Absent good data, the department should be exercising great caution with managing the population of bears and cougars.
- Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for 'trophies' and recreation.
- I urge NM Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.

As a NM landowner, I applaud the NM Fish and Game Department for using sound science to make wildlife management decisions. For those who don't understand true conservation methods and oppose lawful, regulated hunting practices, I would suggest they volunteer to apply wildlife condoms to male bears and cougars to help regulate their reproduction rates. After successfully doing so for several years, I will be open to supplementing current hunting means/methods of wildlife management with a privately funded condom application program.

Sincerely,

Pablo Davila

NMDGF,

Respectfully requesting that given the immense value of bears and cougars to New Mexico, and the true uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised, by at least 50%.

As you are aware, accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. It lacks empirically sound and peer reviewed scientific method, randomized control or internal validity, free of internal bias. Furthermore, there is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends.

As you know as well, bears and cougars are highly intelligent and sentient species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

I advocate for a more balanced and sustainable approach to protecting New Mexico's wildlife. With its success, NM can become a model of democratic, effective wildlife policy-making.

Our state's wildlife deserves better. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

These decisions should not be determined solely by a select few but should be a matter of public interest and informed, democratic decision-making, consistent with the commitment to equitable representation.

Thank you,
Elena Tillman

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear officials,

I write to strongly urge you to PROTECT our precious, iconic and essential wildlife at all costs – it is time to co-exist with Nature and always resort to NON-lethal methods of wildlife management.

I note the following:

- Given the uncertainty of habitat and population estimates of both bears and cougars, the **quotas for both should be reduced**, not raised. Kill quotas for both species have been unjustifiably high for many years.
- Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.
- Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.
- Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely

result in more bears dying. This is both reckless and cruel.

- The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.
- NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.

- The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.
- NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.
- Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited. Moreover, given the newness of these studies, they are only a snapshot of the current population in a given area. We do not yet have long-term on-the-ground field studies of bear and cougar populations throughout the state that could indicate population trends. Absent good data, the department should be exercising great caution with managing the population of bears and cougars.
- Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for ‘trophies’ and recreation.

I ask the NM Game and Fish to consider broad public opinion and adopt

hunting rules that ban the use of dogs in cougar and bear hunting.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear officials,

I write to strongly urge you to PROTECT our precious, iconic and essential wildlife at all costs – it is time to co-exist with Nature and always resort to NON-lethal methods of wildlife management.

I note the following:

- Given the uncertainty of habitat and population estimates of both bears and cougars, the **quotas for both should be reduced**, not raised. Kill quotas for both species have been unjustifiably high for many years.
- Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.
- Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.
- Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely

result in more bears dying. This is both reckless and cruel.

- The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. Date: Wednesday, September 13, 2023 2:37:02 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear officials:

I write to strongly urge you to PROTECT our precious iconic essential wildlife at all costs. We must learn to CO-exist with nature and use only NON-lethal methods of management!

Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans. Our state's wildlife deserves better. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

To: Public officials at the Department of Game and Fish

If I gave you my opinion of trophy hunters, you would no doubt quit reading. I will say that I believe the predator/prey balance was disturbed long ago by unrestricted Cougar hunting.

I strongly oppose any hunting of our remaining wild animals. I know we have taken their habitats so there is no easy answer.

I oppose your bear and cougar quotas and long trophy hunting seasons, .AND I don't think bears and cougars should be fair game during deer or elk season. I have hunted deer and birds in my time FOR FOOD, and we used every inch of meat and hide. So I'm not against hunting per se. I strongly feel you should reduce your kill quotas significantly as a step in the right direction.

Thanks,

Vicki Ahl

In regards to raising kill quotas on either bears or cougars in New Mexico, given the uncertainty of habitat and population estimates of species, the quotas for both should be reduced, not raised. Kill quotas for bears and cougars have been unjustifiably high for many years.

I am a regular visitor to New Mexico and one of the top reasons I choose to travel there is for the wildlife.

Thank you for the opportunity to comment on this proposed change. I have lived in Timberon, New Mexico, which is within GMU-34, for nearly 40 years. During this time, the number of deer has drastically decreased while the number of cougar has exponentially increased. I have been face to face with a cougar during daylight hours three times in the last 10 years, and seen them from a distance at least a dozen times. My last sighting was actually Tuesday, September 5th, 2023. This is not normal! They should not be in populated areas and they should be moving around at night! They should also be leery of humans, which they are not!! Two days ago two of my neighbors at the end of my road had a lion on camera right up against their homes and the next day I had tracks INSIDE the stalls where I feed my horses. The week before Labor Day one of my customers had three lions on their deck and one was looking in the storm door. Again, this is not normal!!

In my opinion, the quota should be increased, not decreased. There is definitely an abundance of cougar and this is going to be detrimental to humans, soon, if not addressed correctly! I pray that the commission will take this information into serious consideration. You are welcome to contact me with any questions.

Again, thanks for this opportunity!!

Have you ever been attacked by a dog? Scary isn't it! Bears and mountain lions are carnivores and are not choosy as to who is going to be their meal. The more bears and cougars, the less amount of food sources available. Thus; we are potential targets. Our game and fish department does an excellent job if maintaining the numbers allowed in each unit and supply hunt tags as needed.

Example: feral cows on federal land are damaging the food supply. The owners of such cows have not removed them so game and fish moved in and is working on this oversight as you read. We are now seeing bears and cougars in residential properties and I for one, have seen video and photos of such sightings, including a bear in a hospital.

As an avid hunter I pay my taxes, purchase licenses and commit to my goal on my trips spending a lot of time and money doing so. It's not for the kill, I know I'm doing my part in maintaining the population.

Now, as before, we have groups that want to ban hunting. Their dog and pony show sold you on banning traps. Ethical hunters do not use traps. I don't see them banning vehicles that kill more game than most people know of.

I understand a dog was trapped once and died; where was the owner? That person should be their target not traps but they got away with it and won...

I see bear and mountain lions in the mountains most times when I'm in their terrain. I've had one try to rob my frig because I left it outside empty but smelling like the trout I had in there. Respect them when not hunting them. If you allow banning hunting these animals, what's next? Are we going to ban jets, trains, ships, buses, etc. because they'll kill in mass numbers? No, because they're needed to keep us moving. Hunting is needed to keep the population of critters in check. Vote no, please!

To New Mexico Game & Fish:

I am an ecologist who has lived with and studied bears and big cats throughout the world for over 50 years. Both taxa are in severe decline everywhere they struggle to survive.

Hunting is an insult to the alleged intelligence of the 21st century. For taxpayer dollars to go towards salaries of government employees who feel empowered to determine the life and death of other mammals is an outrage. As a family descendent of the Holocaust, your debate about numbers of licenses is equivalent in my mind and heart to discussing a quota on how many Jews, Catholics and intellectual dissidents can be slaughtered this year.

Hunting must be banned in New Mexico. If you seriously believe that the hunter constituency and their irrelevant fees for killing are meaningful, then you have all utterly lost your minds and your souls and represent a disgrace to this and future generations.

Dear NM Dept of Game and Fish,

I OPPOSE the bear and cougar quotas and long trophy hunting seasons. I am respectfully requesting that that kill quotas be significantly reduced to protect our valuable wildlife.

Firstly, states have a duty to manage the trust for the benefit of all the beneficiaries. At a minimum, that includes all NM residents, including the majority of the public that doesn't hunt bears or cougars, about 99% of the population.

Secondly, as trustees of the wildlife trust, the Game Commission and NMDGF has a duty to make decisions based on solid science. In this case, the data used by NMDGF to support the new rule has been widely criticized. Whether the science is adequate or not, the prudent thing for the GC to do as trustee is to hold off making a decision until more information is available. Making a decision based on questionable science is a violation as well.

Please consider the majority (non-consumptive stakeholders) in this decision-making.

Thank you,

Elena Tillman and family

To whom it may concern;

Please listen to the voices of countless New Mexicans regarding raising the kill quota for both bears and cougars. We actually could be better stewards of the land and wildlife if we payed closer attention to the health of the environment and the wild animals that remain.

The hunting proposals that are up for review lack scientific rigour. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates.

Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.

Dear Game Commission Members

Regarding the rule being proposed by NM Game and Fish Biologists, I urge you to seriously consider their recommendations to effective game management and not emotionally charged special interest groups that are not founded on data collection and wildlife science best practices.

Too many times, special interest groups that are not New Mexico citizens interfere with what is best for the state's wildlife and hunting heritage. New Mexico is a state with deep rooted traditional values, hunting is one of them.

It is bad enough that the effective method of small predator control was compromised through the ban of trapping on public lands. Please do not allow the current methods for bear and cougar hunting to share this fate through inconsistent and emotionally charged preferences.

Sincerely,

Nathan Smith

Subject: [EXTERNAL] RE: Response to Proposed Changes to Bear and Cougar Rule
Date: Thursday, August 3, 2023 9:15:55 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To whom it may concern,

I respectfully disagree with the proposal to increase hunting of cougars and bears in New Mexico, especially since it is based on claims made without any science-based evidence. While it may seem like a solution to prevent human-wildlife conflicts, hunting these animals can actually do more harm than good. Research has shown that indiscriminate hunting can disrupt the balance of the ecosystem and lead to unintended consequences.

Furthermore, cougars and bears play a critical role in maintaining healthy ecosystems. They help control populations of prey species and their presence can even benefit other wildlife by creating habitat and providing food sources. Removing these animals can have negative impacts on the entire ecosystem.

Instead of resorting to hunting, we should focus on implementing non-lethal methods to prevent conflicts between humans and wildlife. This can include better education for the public on how to safely coexist with wildlife, implementing bear-proof garbage cans, and using hazing techniques to deter animals from approaching human settlements.

In addition, we should also consider protecting and preserving habitat for these animals to thrive in. This can include creating wildlife corridors and increasing protected areas for them to live in. By doing so, we can ensure that these magnificent creatures can continue to exist in our natural world for generations to come.

Sincerely,

Shawn Oleson

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory. I wish we did not have a NM Dept of Game and fish but rather a Dept of Wildlife. That considered science and ecosystems rather than the money earned from hunting! Please do not raise the hunting quotas for cougar and bears.

Dear Commissioners,

There is NO SCIENCE to support the hunting of predators on the landscape. Predators are one of three types of keystone species that provide stability to the environment-that is SCIENCE. The provision of hunting opportunity of bears and mountain lions is purely for 'sport' and no other reason. Do we really need to be encouraging people to enjoy pastimes that are little more than the terrorizing wild animals for bragging rights. There is no fair chase aspect to bear and lion hunting. Even when hunters claim to eat the meat, it is not their priority. As an apex predator, these animals are not consumed in the wild and as hunters claiming to be part of 'the wild' consuming only prey would be the logical end of being a human hunter. It is time for predator trophy hunting to be identified for what it is-a sport. A blood thirsty sport, with no basis in science. Over and over and over, research shows that deer populations are not saved by removing lions. (Hurley, Elbroch, Pierce, Hebblewhite) Lions, bears and ungulates have coevolved for millenia. Human degradation of habitat and stochastic events have had the greatest impacts on ungulate survival.

Sincerely,
Jane Webster

From: [Mark Mattaini](#)
To: [DGF-Bear-Cougar-Rules](#)
Subject: [EXTERNAL] Rationale for supporting state proposal
Date: Wednesday, October 25, 2023 7:12:38 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

An analysis from the *Wildlife Society Technical Review states*:

“State management programs for carnivores enable wildlife managers to pursue a variety of objectives in the public interest, including conservation, hunting opportunity, human safety, reducing predation on wild ungulates, and mitigating damage to private property, including livestock. Moreover, big game hunting opportunities generate revenue from the sale of hunting licenses and taxes on hunting equipment, which help finance law enforcement, habitat improvements, monitoring, and research. Together, public involvement, associated revenue, and professional management are key components of a process known as The North American Model of Wildlife Conservation” (Organ et al. 2012).

All of these factors are important in wildlife management efforts provided by the NMDGF. To examine that work, I met with Nickolas Forman, the [Carnivore and Small Mammal Program Manager for the New Mexico Department of Game and Fish](#) on October 11, 2023, to discuss questions raised by some of our members related to the state management of cougars. State management in different regions of the country often vary, with goals ranging from reduction, stabilization, or increase of independent cougars over time. Mr. Forman clarified that the established goal of the New Mexico state game commission is maintaining stable healthy populations of game statewide; this is therefore also the stated goal of the NMDGF staff.

A central factor contributing to determinations of numbers of tags for each game unit is the availability of adequate cougar habitat. Statewide, there are approximately 2 cougars per 100 km², but this is significantly variable depending on geographic elements and human populations. Population estimates are localized primarily based on the harvest matrices collected annually. Appropriate harvest rates may increase or decrease over time, given changes in harvests and characteristics of land and populations within regions and game units. The state also considers all of the considerations noted in the Organ quotation above, including shifts that local people may indicate as desirable, by reviews of harvest and other data across multiple years, changing human and geographic changes, issues of excessive predation, or lack of opportunities for involvement for residents and visitors. (In the case of cougars, there are nearly always available tags, so predation can often be handled by those affected, ranchers for example.)

GPS tracking collars, trail cameras, and advanced Spatial Mark-Resight models contribute to the available data used to determine harvest limits in ways consistent with current research. Additional critical data about populations within, across, and among game units including age, sex, and elements of health and parturition for harvested cougars are also provided by the conservation officers and other NMDGF staff. The NMDGF has recently initiated additional statistical analyses identifying more advanced bayesian inferences for constructing the best models for understanding data, adjusted for time. All of these data sources inform and support the new Integrated Population Model recently adopted by the NMDGF, potentially allowing data integration across up to 20 years, and will also be helpful in clarifying the impact

of climate change over time. ^[1] More research and collaborations with university programs would of course be useful, but the combination of methods and analyses currently used appears to be consistent with current science and provides considerable high quality information and breadth useful for game management.

Over the past five years, given the state's estimated total population of 3494 independent cougars, the number of tags available has averaged 620; the number harvested has averaged 338 (10% per annum of a population of 3494). The average annual number of female tags available has been 174; the average actual female harvest has been 88 (26% of the harvest but only 3% of the indicated 3494 total state population). Given these numbers, current harvests and the minor changes prop do not seem excessive.

Subject: [EXTERNAL] Re change in Bear/Cougar hunt limits
Date: Sunday, July 30, 2023 10:14:49 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Reading the proposed rule, I am not seeing any justification for the proposed changes that will expand ranges, increase allowable hunting of females, and open hunting dates. As all three of these changes would likely increase the numbers of each species lost, I think they need to be justified before any rule-making occurs, with allowable time for the public to assess those justifications.

As climate change and increased heat stress the ecosystems throughout the state, I cannot support human efforts to reduce any population and further disrupt the balance without clear and evidence-based justification for such a proposal.

I do applaud the use of more evidence-based approaches in deriving the limits by expanding the efforts to estimate populations. But if more accurate estimates of population are being obtained, it is even more puzzling why the proposed changes are not justified by clarifying the need. Without that justification this appears to be a process more heavily slanted to short-term hunter needs than to long-term species protection. Such an approach ultimately hurts goals of all in the long-term.

Subject: OPPOSE black bear rule

To Whom It May Concern:

On behalf of the Humane Society of the United States, Animal Protection New Mexico, the Rio Grande Chapter of the Sierra Club, and our members and supporters in New Mexico, we thank you for this opportunity to comment on New Mexico Department of Game and Fish's four-year, proposed rule for black bears. Given the immense uncertainties New Mexico black bears face, we request that NMDGF reduce their proposed bear-kill quotas by at least 50%. We provide a summary overview of our comments and full, cited comments follow.

Summary:

- A. New Mexico's black bear population density and abundance determinations made by department of Game and Fish personnel have been wholly insufficient, are undiscoverable and therefore must be assumed to be scientifically indefensible. Since the public has not been provided with tangible

reasons to trust the department's conclusions, the Game Commission must lower statewide black bear quotas. The NMDGF has redacted (blacked out) population data from our public information requests, making a study of their population calculations (peer review) impossible. The process involving NMDGF's proposal to raise the black bear quotas has been unnecessarily secretive, and the public has been kept in the dark. Instead, NMDGF initially developed a document totaling 1.5 pages that encompassed both its proposed black bear (*Ursus americanus*) and cougar (*Puma concolor*) rule changes and then suddenly updated that document with a few more pages in early August. NMDGF will accept comments on its proposed rules until an unknown date in September, at which time it will prepare final draft rules for both bears and cougars that will be posted to its website. It is uncertain if the public will have an opportunity to review and comment on these final draft rules before the Game Commission makes its decision in October. The public has little information about the studies NMDGF relies upon to make population determinations, and we have seen no population management objectives (other than implicit hunter satisfaction and future hunting opportunities). In other words, the process by which these rules were drafted and the public engaged, is a failed course of action.

NMDGF's bear-population determinations are based upon an unscientific and crumbling foundation because New Mexico's bear studies are woefully outdated. Those old studies were conducted in New Mexico's best bear habitats. Then NMDGF took those high-density numbers and mysteriously generalized them statewide—artificially inflating estimated population figures that likely have no basis in reality.

NMDGF has not embarked on year-to-year population studies so it is not possible to know how bear populations are trending and thus whether current hunting is sustainable, much less whether increasing hunting quotas will be. NMDGF's claims, that New Mexico bear management is sustainable, are not backed up by current empirical data.

NMDGF has not factored in climate instability into its bear hunting proposals. It has not considered the 20-year *megadrought*—a drought not seen since 800 A.D.—and the historic wildfires which killed bears and destroyed their habitats, including last year's wildfires (the largest in New Mexico's recorded history), into its quota-setting process. Because New Mexico's bear population suffers from low genetic diversity, because those populations are poorly connected to others and because the climate crisis will only worsen, New Mexico's bears face a bleak future that will not be able to withstand over-hunting.

When an activity potentially threatens the environment, the *precautionary principle* warns that the proponent of that activity assumes the burden of proof and must act with restraint. NMDGF has not met this burden but rather has thrown caution to the wind with bear quotas that are likely to damage New Mexico's black bear populations. **For those reasons, the Game Commission must lower statewide black bear quotas to prevent inbreeding and the loss of bear populations that are uniquely adapted to New Mexico's arid habitats.**

B. NMDGF proposes not to count all sources of bear mortality as part of its quotas, including disease, predator-control kills, human-bear conflict kills, road-killed bears and the significant amount of annual bear poaching. Black bears are slow to reproduce and can only withstand **between 4% and 10% total mortality**, and failing to include total mortality amounts to flawed wildlife management. For all of these reasons, **the Game Commission should not only reject any increase in hunting quotas but also should call for quota reductions statewide.**

C. Hounding bears with packs of radio-collared hounds is not fair chase hunting and using archery equipment is cruel and results in uncounted wounding losses. Hounding harms non-target species, including deer and domestic livestock and results in deaths and injuries to *federally protected Mexican wolves*, bear cubs, and results in deadly fights between bears and hounds. It causes both bears and hounds to die from heat exhaustion. Using archery equipment to hunt bears results in prolonged deaths

of bears and wounding losses that are never counted in bear quotas. For these reasons, **the Game Commission must abolish hound hunting of bears and the use of archery equipment to hunt bears.**

D. Researchers have found that black bear hunting does not resolve human-bear conflicts, and, may in fact, worsen them. Also, trophy hunting bears does not reduce attacks on humans—but keeping dogs on leashes in bear country does. NMDGF must engage Bear Wise or Bear Smart strategies to prevent future conflicts in both urban and rural areas—because human-bear conflicts are entirely preventable with planning.

E. New Mexico’s wildlife managers should develop a comprehensive management plan informed by the best available science. That management plan should clearly spell out goals and objectives so the public and decisionmakers alike are not kept in the dark. No such plan currently exists. The public is being kept in the dark about even the most basic aspects of the department’s bear management plans in New Mexico.

F. Family oriented black bears hold intrinsic, social and economic values, and provide incalculable benefits to their ecosystems. Highly intelligent, devoted black bear mothers spend up to two years raising their very few cubs they produce. Among other myriad benefits they provide, bears also spread more seed than birds. Furthermore, the public loves viewing and photographing bears. For these reasons, the Game Commission must conserve and protect black bears for future generations.

G. New Mexico law confirms that black bears must be conserved for all citizens. It is axiomatic that “agencies are created by statute, and limited to the power and authority expressly granted or necessarily implied by those statutes.” *Qwest Corp. v. New Mexico Pub. Reg. Comm’n*, 140 N.M. 440, 446 (N.M. 2006). Thus “the Legislature, not the administrative agency, declares the policy and establishes... standards to which the agency must conform.” *State ex rel. Taylor v. Johnson*, 125 N.M. 343, 349 (N.M. 1998). Here, the New Mexico Legislature created the Game Commission in order “to provide an adequate...system for the protection of the game and fish of New Mexico” and “to provide for their... protection, regulation, and conservation...” N.M.S.A. § 17-1-1. In promulgating rules and regulations pertaining to hunting, the Legislature expressly directed the Commission to give “due regard” to “the distribution, abundance...and breeding habits” of particular species. N.M.S.A. § 17-1-26. And, like all New Mexico agencies, the Game Commission may not establish rules that are “not supported by substantial evidence” or that are enacted “arbitrary or capriciously.” N.M.S.A. § 39-3-1.1(D). Taken together, the statutory scheme authorizing this rulemaking requires evidence-driven, scientific management that seeks to sustainably maintain wildlife populations.

H. Conclusion. Because so many uncertainties exist with NMDGF’s proposed black bear rule, we provide these comprehensive comments, including **all journal articles cited herein as part of the administrative record and are available here: https://drive.google.com/drive/folders/1u_FIDR1428yw5ZInlPf3GqeTeorOfDJ0?usp=sharing**. This is done with the hope that the final rule will be informed by sound science and developed with clear objectives and goals, including for reducing human-bear conflicts, ensuring that black bear populations in New Mexico are genetically fit for long-term adaption in the face of so many threats to their persistence, including loss of habitats and travel corridors, extreme droughts, and severe, wholly unprecedented wildfires.

The Game Commission must reject the proposed black bear quota increases as they have no basis in science and could lead to the loss of New Mexico’s uniquely adapted bear populations. The Game Commission must include in its final quotas all sources of mortality. Given the immense uncertainties

New Mexico black bears face, we request that NMDGF reduce their proposed bear-kill quotas by at least 50%.

To prevent the harm to non-target species including Mexican wolves, deer and domestic livestock the Game Commission must disallow the hounding of black bears. Hounding of bears is a controversial practice that is not fair-chase hunting, and has no place in New Mexico's hunting regulations. The Game Commission must also disallow archery equipment to hunt bears because it does not result in quick, clean kills but prolongs a cruel death that can result in dead bears not being counted toward quotas. Black bears are ecologically important to their ecosystems. They hold inherent values and are much beloved by the public. The NMDGF must create a comprehensive rule supported by scientific justification for management of black bears and begin to work on a credible, long-term black bear management plan that outlines goals and objectives, including conserving New Mexico's black bears for future generations. Additionally, we believe the public has the right to expect NMDGF to disseminate final draft rules, along with discoverable and detailed scientific justification for those rules using the best available science, rather than providing vague, indefensible, incomplete, and incoherent rules that shift throughout the comment process.

Thank you for considering our comments.

Sincerely yours,

Wendy Keefover

On Thu, Aug 10, 2023 at 8:44 AM dave kraig <dharry686@gmail.com> wrote:

I am writing in opposition to the proposed "bear and cougar rule" invoking increased quotas and hunting seasons for bears and the year-round cougar-hunting season.

Not only is the proposed rule based on faulty science and analyses, it ignores the incredible stresses that prey animals are already under from fires, drought, habitat loss, and forage scarcity. It also ignores the collateral effect that killing adult cougars and bears has on their unprotected and unfed progeny. The rule would have a profoundly negative effect on cougar and bear populations and health.

The studies used to justify these hunting increases appear to have cherry picked data to support their case rather than rely upon balanced studies that accurately characterize the health of the target populations.

Please do not implement this new rule. Instead, reconsider and reanalyze appropriate data and make an honest assessment of the impacts of climate change, habitat loss, and other rapidly evolving factors and redraft a bear and cougar rule that genuinely protects these incredible animals and ensures their long-term viability.

Thank you for your consideration,

Dave Kraig

Dear New Mexico Department of Game & Fish,

Game management is a science, and therefore, you cannot propose a new management strategy without doing the science first. The effects of climate change on habitat has and will continue to make life harder for bears, cougars and all species survival. While I hunted bear, with dogs when I was a kid, I no longer believe in the shooting of any predators for trophy purposes (we did eat the bear meat) with or without dogs. I consider it a gift to see these animals in the wild now and oppose any increase in quotas for them.

Sincerely,
Mike sauber

I belong to PATHWAYS :WILDLIFE CORRIDORS OF NEW MEXICO. Our mission is to seek connectivity for our AMAZING wildlife focusing on Placitas and the Sandias. However, every opportunity must be taken to ensure the safety and well being in our state of our cougar and bear populations as they are diminishing. Trophy hunting on private lands should be illegal, large spaces need to be protected for these incredible predators, habitat monitored to keep it healthy and thriving (albeit difficult with climate changes). We need to acknowledge the importance of other species --their purposes--as we move forward.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Department of Game & Fish,

I do not support extending quotas of hunting seasons on bears or cougars in New Mexico. These are not animals hunted for sustenance and they have important roles in the ecosystem, such as helping to keep herds of prey animals healthy and populations in check. Therefore I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Alyson Bigney

Dear Commissioners,

New Mexico's approach to maintaining its rich biodiversity, especially regarding the bear and cougar rule, speaks to its deep commitment to conservation and management. It's crucial to continue placing trust in the expertise of New Mexico Department of Game and Fish biologists, who ground their recommendations in rigorous scientific research. Protect the hunts!!

Sincerely,
Michael Schubert

Dear Commissioners,

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The state's predator population is already a problem and was even before the trapping ban. The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example. One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Sincerely,
Deborah A Elliott

Dear Commissioners,

Protect cougar and bear hunting!! Each region boasts its unique challenges and merits when it comes to wildlife management. New Mexico's diverse ecosystems and longstanding hunting traditions demand policies tailored to its specific needs. Turning to evidence-based approaches and learning from the successes and failures of other regions will ensure a prosperous future for New Mexico's wildlife.

As a California resident and hunter, I have watched as lion and bear populations have exploded, decimating many other wildlife populations. More mountains are depredated annually than were ever killed by hunters. More death not less is what unnecessarily restricting hunting and especially hound hunting. We are many people protest and complain about hunters but they do not pay for the consequences of unscientific opinion.

Sincerely,
Daniel Epperson

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To whom it may concern,

I strongly oppose the currently proposed bear and cougar hunting permits and seasons. In fact, trophy hunting is in itself a heinous and cruel “hobby” and has no place in New Mexico, where we all depend on our natural environment, biological diversity and intact wilderness areas to survive.

Bears and cougars are an integral part of the ecosystem, keeping populations of ungulates under control and most importantly enriching our lives with their existence. They have as much right to live as any trophy hunter does.

All of wildlife is now under critical threat from extreme heat, wildfires and drought. Fish and game regulations should recognize that there is no safe level of hunting that will allow these beautiful beings to thrive in our state. Every species will now struggle to survive.

Your proposed regulations must be changed to assume that bears and cougars are critically endangered by climate change and protect them accordingly.

Sincerely,
Saraswati Khalsa, Espanola

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Hello NM Dept of Game & Fish,

I have a proposal which I hope you will consider – – rather than extending the hunting season and increasing hunting permits for bears and cougars, how about a moratorium completely of hunting bears and cougars this season, so that the populations can be properly assessed, and the effects of this blood sport can be evaluated.

Also, the idea of fair chase practices could stand a refresh – – I understand dogs are used to chase these already drought and heat-stressed animals to exhaustion and then the hunter, once they locate their dogs, has the exhausted animal in his snares. Is this really something worthwhile to engage in and promote?

I also understand that the killing of adult mature animals can leave a power void in the pack and thereby contribute to conflicts with human residential areas.

So, to clarify – – as a resident of Albuquerque, I am opposed to extending the hunting season for bears and cougars, I am opposed to increasing permits for such killing, and I am opposed to the use of artificial means (dogs, beacon locator collars) to track and eventually kill these wild animals.

Thank you.

Janice Convery
Albuquerque, NM 87102

Subject: [EXTERNAL] Reduce Killing Quota if NM's Bears and Cougars
Date: Tuesday, July 18, 2023 7:09:35 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear NM Game Commission,

I am deeply concerned for the well-being of our state's bears and cougars given the proposed raising of killing quotas for both. Please consider the following significant points, and take reasonable, compassionate action for these creatures who gravely need your protection:

- Given the uncertainty of habitat and population estimates of both bears and cougars, the **quotas for both should be reduced**, not raised. Kill quotas for both species have been unjustifiably high for many years.
- Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.
- Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.
- Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both

reckless and cruel.

- The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.
- NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.
- Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited. Moreover, given the newness of these studies, they are only a snapshot of the current population in a given area. We do not yet have long-term on-the-ground field studies of bear and cougar populations throughout the state that could indicate population trends. Absent good data, the department should be exercising great caution with managing the population of bears and cougars.
- Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for 'trophies' and recreation. Ask NM

Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.

Thank you for caring about wildlife and for your consideration with this very important issue concerning these creatures.

Sincerely,

Jennifer Sprague

From: [Ellen Taylor](#)
To: [DGF-Bear-Cougar-Rules](#)
Subject: [EXTERNAL] Reduce Quotas and Hunting Season Length
Date: Sunday, August 6, 2023 1:00:07 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Given the long-standing drought in New Mexico's, the two record-breaking forest fires last year, and the hottest July on record, both people and animals are struggling, but humans, at least, don't have to face being further decimated by hunters with radio-collared hounds killing for trophies.

The basis for this year's inflation of bear and cougar populations to justify an increase in quotas and to establish longer hunting seasons for bears and a year-round cougar-hunting season is ludicrous. It is obvious to me that in the huge area affected by last year's fires, as well as the entire state of drought and heat-stricken New Mexico, bear and cougar populations cannot be thriving and increasing, and this needs to be factored into the Game and Fish Department's calculations. A science-based analysis must be undertaken and rules then based on that analysis. The Department must figure out how many bears and cougars there are, really, and how climate change will affect those numbers.

The climate is changing. We are losing trees and species and green chile crops and the Rio Grande, and animals are more endangered now than ever. I'd like to think that in a few generations, children will still be able to see a cougar or a bear in the wild, but it is increasingly unlikely. Instead, I believe that humans in the future (if there is a future for humans) will look at our actions and say, "How could people be allowed to hunt bears and cougars, and not even for food or because it was necessary to reduce populations, but purely for trophies - and it only cost the hunter \$43 per cougar and \$47 for a bear - and now there are no more bears and cougars?"

As Charles Fox said in his Albuquerque Journal piece of July 30, 2023, "New Mexico should not be managed as a pay-to-shoot game farm." Future generations, I fear, will be horrified by our embrace of recreational killing. I'd love to see it banned, but that's not very likely, so let us, at least, base the quotas on scientific evidence and not guesswork. The bear and cougar rule this year must reduce - not increase - the quotas and length of hunting seasons based on the evidence that is right in front of our eyes.

Thank you for this opportunity to comment.

Dear Game % Fish Commission,

The recent news that the Department of Game & Fish is considering increasing the hunting limits for cougars (and bears) is really distressing - at best.

In fact, it is not supported by research and policies designed to protect and improve our natural wildlife environment.

Cougars help maintain a healthy balance in nature as they prey upon deer and elk that can rapidly overgraze fragile forest lands. Cougars do not multiply quickly and many cubs are lost to natural causes yearly.

Increasing hunting limits does not help control a cougar population - rather it targets helpless cubs and females when they are most vulnerable. Increasing the hunting limit also decreases the genetic pool for these incredible animals.

We owe a lot to future generations and there is absolutely no need to further destroy what special creatures we still have left in an environment that is under tremendous threat.

Please do not increase hunting limits on behalf of all young people who want a world rich with wildlife and beauty!

Sincerely, Sharon Dogruel

To whom it may concern,

Please consider the guidance from top researchers at fish and game agencies is that all sources of human-caused mountain lion deaths should not exceed 12%-16% of the adult mountain lion population, not 17-24%.

- The agency should set quotas lower than that to account for lions killed by traffic or in response to depredations.
- Mountain lions are beloved animals, necessary for the wellbeing of New Mexico's wildlife and its wild lands.
- Excessive hunting can make conflict with livestock and human populations more likely.

Thank you for your time and consideration in creating sustainable relationships with our earth kin.

Sincerely,
Natalie Paynter

When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the public also show opposition to killing bears and cougars using these methods for 'trophies and recreation. Ask NM Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.

Don't raise limits for bear and mountain lion hunting

Also see this article in the Sunday Santa Fe New Mexican for further facts and opinions with which I agree:

https://www.santafenewmexican.com/opinion/editorials/dont-raise-limits-for-bear-and-mountain-lion-hunting/article_40651e26-24d9-11ee-981f-b7fc5ff9a70e.html

Subject: Maintaining Equilibrium: Upholding the Importance of Consistent Bear and Cougar Regulations in New Mexico

To Whom It May Concern,

I am writing to express my strong support for maintaining the current rules and regulations concerning the management of bear and cougar populations in New Mexico. As stewards of our natural environment, it is essential that we strike a delicate balance between conservation efforts and public safety. The rules in place that govern these apex predators have demonstrated their effectiveness, and any alterations could potentially disrupt the equilibrium that has been established.

Bears and cougars are integral components of New Mexico's diverse ecosystems. They play critical roles in maintaining ecosystem health and biodiversity by controlling herbivore populations and influencing the structure of plant communities. Altering the current regulations could disrupt these roles, leading to unforeseen consequences such as overpopulation of prey species and habitat degradation.

Furthermore, consistent rules regarding the management of bear and cougar populations are essential for public safety. By keeping these regulations uniform, citizens can be better educated about how to coexist with these predators, thus reducing the potential for conflicts and promoting responsible outdoor behavior. This is especially important in a state like New Mexico, where outdoor recreational activities are a significant part of the culture and economy.

Maintaining the current regulations is also vital for research and data collection. These regulations have been developed based on a thorough understanding of the behavior, ecology, and population dynamics of bears and cougars. Any changes could disrupt ongoing research efforts and hinder the ability to accurately assess the impact of these predators on their ecosystems. Consistency is key for building a robust body of knowledge that guides informed decision-making.

In conclusion, I urge the New Mexico Department of Game and Fish to maintain the importance of consistent bear and cougar regulations. These rules have been carefully crafted to strike a balance between conservation and public safety, and any alterations could upset this equilibrium. By upholding the existing regulations, we can continue to protect the state's natural heritage and promote responsible interaction between humans and wildlife.

Thank you for your dedication to preserving New Mexico's unique and precious ecosystems.

Sincerely,

Jeffrey Soule

To Game and Fish,

The proposed kill numbers for cougars and bears aren't scientifically supported. These animals' numbers are better off self-regulated. Do not allow overkill of these animals who are already at risk from extreme heat, drought, and habitat loss. Vote no to this proposal.

Thank you,
Peg Froelich, Jemez Springs

I am an avid outdoors man and I strongly support the department of Game and Fish to regulate the hunting of Bear and Cougar. Both species must be monitored on a yearly basis as to their numbers or they can become a problem for farmers and ranchers and their livestock. Cougars especially should be watched closely not only to the livestock but to Elk and Deer. Cougars can deplete populations of Mule deer in a very short time span by killing mature bucks every week. This is a fact and not an opinion. I will continue to support our Game and Fish officials and their guidance. Thank You

Dear Commissioners,

Around the globe, hunting has always been a key player in wildlife conservation. The funds accrued, the management of animal populations, and the monitoring of habitats have yielded positive results. It's imperative to understand that discontinuing practices such as the use of hounds for bear and cougar hunting in New Mexico might have ripple effects. Such decisions, if made, should be backed by scientific data and not merely popular sentiment. Keep the hunts!

Sincerely,
Edward Lachendro

Dear Commissioners,

New Mexico state law that spells out the state's bedrock policy of wildlife management. The law calls for providing "an adequate and flexible system for the protection of the game and fish of New Mexico and for their use and development for public recreation and food supply, and to provide for their propagation, planting, protection, regulation and conservation to the extent necessary to provide and maintain an adequate supply of game and fish within the state of New Mexico." It is not only necessary and appropriate for NMDG&F to use scientific based management strategies including hunting to manage predator populations, but it is also the law.

Sincerely,
Matthew Chilcoat

Dear Commissioners,

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The state's predator population is already a problem and was even before the trapping ban. The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example. One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Sincerely,
Jesse Young

Dear Commissioners,

Please keep the bear and cougar hunts. Follow the biology and don't cave to a liberal agenda like California has. As the world changes, so do perspectives on hunting. New Mexico has a chance to set a precedent by ensuring that hunting practices are not only sustainable but also ethically sound. Proposals, such as making it mandatory for hunters to retrieve edible portions from their game, can deter criticisms and emphasize responsible hunting. It's not merely about preserving New Mexico's hunting traditions, but also about evolving them for the better.

Sincerely,
Dwight Guynn

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Don Parsons

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,

Dear New Mexico Department of Game & Fish,

New Mexico, my home, is a uniquely beautiful state and the variety of wildlife here is something to value, preserve and protect. I would assume that the New Mexico Dept. of Game and Fish has, as its reason for being, a certain responsibility to act as stewards of the environment. The proposed changes addressed below regarding hunting of cougars and bears in no way reflects any sense of stewardship. Rather it would seem to pander to a specific portion of the population that calls what they do "hunting," but which is, in reality, no more than blood sport. To chase an animal to exhaustion, tree it and then shoot it so its head or pelt can be hung on a wall may have been standard practice in the days of the Wild West but today reflects an inhumane, even cowardly behavior that one would hope we have evolved beyond but which, shamefully, is still tolerated--even promoted.

Cougars and bears are not over populating the state. They actually self regulate their numbers and their intrinsic value to the environment is not debatable. Every animal, humans included, has the right to water, food, shelter and space. Unfortunately we humans have abused that right by always placing ourselves above the natural world and the current climate disaster, fires, droughts, etc. can be attributed in very large part to our disconnect from that world. Every species is part of an environmental whole that exists to keep this planet in balance. Because of human activity too many species are struggling as their habitats shrink year after year. Bears and cougars are part of that struggle. Proposing to kill more of them, for little more than the sake of killing, is illogical, unconscionable and totally irresponsible. New Mexico Game and Fish should instead set itself up as an example for the rest of the country as a state that promotes protection of its wildlife and does everything possible to ensure peaceful, balanced co-habitation with all species. No bear, no cougar, no animal is expendable just to suit us.

I strongly oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Carol E Gentry

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
April Woolley

- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Michael Miller

Dear New Mexico Department of Game & Fish,

I strongly oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy and likely flawed notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

Dear New Mexico Department of Game & Fish,

I am sending along the following petition as I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Peter Kray

- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

There is no profound countervailing need for increased hunting of these creatures, many of whom are killed regularly due to their accidental incursion into WUI areas. Until NM Game and Fish has a solid basis for determining that the population of these animals is too high, there is no basis for this proposed rule.

Thank you.

The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Debra Stark

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

I have seen two cougars over my 15 years in New Mexico. To see one is a reminder of how special an animal it is. Black bears are seen more regularly, as they raid poorly closed dumpsters. But they too are special animals and should NOT be hunted at all, in my humble opinion. There are more than enough deer and elk around to satisfy any hunter.

Thank you.

Sincerely,
Michael Flood

A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Linda Frazer

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Dear New Mexico Department of Game & Fish,

For the following, very important reasons and as a registered voter in New Mexico, I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Unless you can show otherwise, your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Here's how you can responsibly respond to this misguided effort: Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Frank Lampe

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Patty Navarrete

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Without knowing more about the populations of bears and cougars in the state, this is unconscionable

Despite questionable numbers, your department's proposal gives no consideration of the effects of climate change on these populations, including their food sources and habitats. As someone who lives in a community where we used to see bear and mountain lion and many signs of them, it has been years since we have even seen scat, let alone an actual animal.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Margaia Forcier-Call

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Brian Christian

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
MAUREEN O'REILLY

Dear New Mexico Department of Game & Fish,

As a family of 5 with long standing in the community who have lived in harmony with bears and cougars for decades, we ardently oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions. We personally know this first hand from our own work on the ground. Your numbers are flawed not site specific and mostly based upon road kill.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Aaron Corley

Dear New Mexico Department of Game & Fish,

We should not go back the wildlife management principles of the 1880s. We know more than they did and understand our responsibility to intelligently use science to regulate hunting.

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Dear New Mexico Department of Game & Fish,

This is a terrible idea for many reasons.

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

What you are proposing is so harmful, cruel, inhumane, and ignores the scientific, ecological value of these wonderful animals.

Please reconsider and protect them instead of killing them.

Thank you.

Sincerely,
Dixie Parker

A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Charalambos Papelis

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Dr. Jami D. L. Hart

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Sue Schümmer

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
CHRIS Calvert

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Cheryl Williams

A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

-----Bears and cougars are not trophies. They are not mere objects but living and feeling beings who play important roles in nature plus should have the right to live in peace and survive and thrive as a matter of principle. One person is killed and it is considered a tragedy yet hunters wantonly kill wildlife for the thrill of hunting and killing, glory, and the boosting of egos. Killing predators has completely upset the balance of nature. While I would not hunt, some do so for sustenance but to be able to just kill as many as one wants to is appalling, unethical and irresponsible. We humans have had and continue to have a devastating effect on nature and wildlife and it is bad enough it is legal to kill any wildlife/predators, it is much worse to set no limits. I have felt the need to say too many times that humans are not special or the most/only important species but merely the one with the power-power that is too often abused. Our greed and human centricity are what have caused so much harm for wildlife and nature.----

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.

Dear New Mexico Department of Game & Fish,

During one of the more recent droughts here it was widely reported that hundreds of bears had been killed because they'd been raiding homes and ranches for food. I also had two Game & Fish employees tell me they expected hundreds more to die during hibernation because they hadn't gotten enough food before denning up for the winter. Meanwhile our cougar population is also in decline due to habitat loss, hunting and even vehicular accidents. There is no reason whatsoever to expand the amount of hunting licenses issued in the state other than the minimal revenue those licenses produce. Who is pushing for this expansion? It's individuals and organizations who will generate additional revenue from such activities, and that does not represent the majority of New Mexicans.

Mike Sloan, you know better. Do NOT approve or champion this expansion because the additional animals killed will ultimately damage the environment.

Sincerely,
Jon Asher

Dear New Mexico Department of Game & Fish,

We have been in drought for a long time. They are struggling more than we are. To extend the season for hunting, allow dogs and raising the quota unfairly impacts a delicate balance that is barely existing right now. Please consider the wild life of bears and cougars for the future generations.

Sincerely,

I have been blessed to have 5 bears in my yard, the only mountain lion was a kill in someones pickup, but I got to pet it and realized such an Angel With Paws and Claws. I have experienced Game and Fish trying to trap a bear in my yard, but he had experienced the trap before and would not enter it. These a very intelligent animals and if hunting is allowed a license should be issued and this be the only way to allow hunting of these animals!

Dear New Mexico Department of Game & Fish,

I fully support Game & Fish's role in wildlife management because of the importance its role has in balancing the imbalance human activity has created. But I recognize the importance of doing it right and doing it right relies upon utilizing the best science-based approaches, especially in the area of wildlife habitat connectivity. Thus I support the following statement:

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Department of Game & Fish,

My husband & I & our family are Citizens, Taxpayers, & VOTERS, as well as people VERY DEEPLY CONCERNED about our rapidly degrading natural environment, & our remaining, increasingly threatened wildlife. We are also strong supporters of protection & preservation of ALL our wild Public Lands, & the habitats & ecosystems they contain.

Therefore we must, IN THE STRONGEST POSSIBLE TERMS, voice our adamant opposition to the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars, by means of:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

The above proposed provisions are outrageously ill-informed & very destructive.

These vague stipulations you propose, would essentially give FREE REIN to hunters & other gun lovers to indiscriminately & senselessly kill these magnificent, highly sentient, & utterly defenseless animals!!

You have obviously not considered that these members of two keystone predator species have any intrinsic value, let alone any right to live their lives out in the natural order. You must be reminded that top predators help keep herbivore & other prey animals' populations in check, & healthier, by culling the old, the weak, & any who are ill. This means the prey species are stronger en masse, & that their numbers do not exceed reasonable levels, which in turn ensures the better health of their ecosystems!

Moreover, there is NO way to monitor the actions of hunters, or thrill or trophy seeking target shooters, wishing to see large animals die for their egos & twisted pleasure!! This means that many animals will suffer & die, some after being wounded but not killed outright. This is profoundly immoral!!

It appears also that there has not been any accurate population censuses of New Mexico's bears & cougars, who will be the hapless subjects of your kill proposals. Your department has only a most hazy notion of how many bears and cougars live in our state, since you merely form estimates of their numbers, by extrapolating from very limited study areas, to much broader regions.

Despite these questionable numbers, your department's proposal gives NO consideration to the effects the climate emergency may have on bear food sources and habitat.

The climate emergency/catastrophe has already arrived, & has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find. This means, bears will be under more natural hardships & treats than before, leading to increased fatalities..

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and land instead, on the side of prudent wildlife management by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting ENTIRELY the use of hounds in bear and cougar hunting.

You MUST protect New Mexico's wildlife from the terror of pursuit by hounds & other hunters, the suffering their killing will entail, & in fact, the virtually unregulated, wholesale slaughter of the iconic & environmentally important animals.

Your new proposal WILL NOT do this, & MUST BE REJECTED!!

Thank you.

Sincerely,
Monica Steensma

Dear New Mexico Department of Game & Fish,

Let me begin my comments this way: the planet is long past the time when we can kill some/save some in the old Game and Fish pattern. Killing of any keystone species threatens our entire NM ecosystems, already hammered by fires and other effects of climate change.

I believe the Center for Biological Diversity puts it very well, as follows:

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. Dear New Mexico Department of Game & Fish,

Oh no! This sounds like another dumb idea from the politically appointed (and altered in accordance with the governor's pet projects) New Mexico Game Commission. Oddly enough, a perusal of the ever-changing board's personal CVs would lead one to believe that such a qualified panel would "do the right thing" for the game (and non-game) animals of our state. (The personnel may change, but the commission was responsible for a 1970s doe season from which NM has yet to recover fully, and actually tried to reintroduce a hunting season on Lesser Prairie-chickens--even as the birds were in steep decline and being proposed for federal ESA listing, and more recently, refused to do away with leghold traps, except where folks are likely to walk their dogs, as if fur trading is a source of great wealth for the state!) Can you hear my eyes rolling?

So, how about just a little science, and a little less gun-happy hyperbole. While working in the autumn Manzanos, we would take in lost hounds and try to return them to their owners during the bear season. Responsible hunters?, certainly not--just guys wanting to kill something. Same with the big cats: I learned long ago not to mention sightings as "hunters"--and their dogs, would show up on my doorstep. Playing to the macho crowd is a poor means of showing concern for the large predators that are an essential, integral part of a healthy ecosystem. More science, less stupidity. Educating the public, especially in places where "development" has decimated the habitat of a host of species, from large to very small, would go a lot further than letting "hunters" pressure the NMDGF into making poor decisions. Decades ago, we called that agency a "hook and bullet bunch"; this is not one of those times that you have to remove any doubt that the appellation is still correct. There is absolutely nothing to warrant these seat of the pants changes. Science, not bullshit.

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.

Dear New Mexico Department of Game & Fish,

I believe the New Mexico Department of Game & Fish needs to step back and consider the outcomes of their recent proposal to kill more black bears and cougars.

Decades of drought and years of severe climate change are wreaking havoc with the habitat and food sources for these two animals. Your proposal to allow further hunting of them could push them toward complete extinction or could allow a harmful increase in the population of their prey. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find. Further research is needed before declaring open season on them.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader geographic areas.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Whatever action you take, please remember that we are in a new climate crisis, making it impossible to do business as usual. The future of all species on Earth is unknowable at this point. Thank you.

Sincerely,
Linda Easley

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions. A recent study in the Jemez Mountains by NPS showed that mountain lions have a short life in the Jemez Mountains because of hunting. Males are recruited from outside this range so cub survival was low to nonexistent due to outside males killing them.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Dear New Mexico Department of Game & Fish,

Black Bears and Cougars are indicators of healthy wild ecosystems. There is no indication in current scientific data that their current numbers are not sustainable in our state, therefore, I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Dear New Mexico Department of Game & Fish,

Bears and cougars are natural to New Mexico and do little to no harm. I live in the forest and respect and acknowledge their right to be here. We prefer the use of rubber bullets to killing.

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Dear New Mexico Department of Game & Fish,

Living in the wilds of NM where these amazing animals live showed me first hand how important they are to the environment, how increasingly rare they are becoming and the tremendous and horrific decimation they are experiencing from people just randomly killing them. You KNOW this is true but ignore it as I have reported it continuously and NOTHING was ever done about it. I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.

Dear New Mexico Department of Game & Fish,

I have attended NM Dept. G&F meetings for years as a representative for wildlife conservation interests which supposedly the G&F Dept. takes into consideration when updating their bear and cougar rules. Nothing could be farther from the truth. This department works strictly for hunters, many of whom are out of state trophy hunters. For all the good it will do

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Department of Game & Fish,

I strongly oppose the New Mexico Department of Game & Fish's proposal to allow the killing of more black bears and cougars. There is absolutely no need for this rule. Moreover, the proposal is fatally arbitrary by:

- 1) Making unspecified increases to hunting quotas on no scientific basis.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions. Your department has no basis to conclude that bear and cougar populations can sustain additional human mortality.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find. The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity.

The proposal doesn't address how the use of hounds in hunting puts nontarget animals in danger and risks human safety, and that lengthening bear hunting seasons compounds these impacts, and makes New Mexico public lands off limits to non-bear hunters for more of the year.

Instead of allowing more bears and cougars to be killed, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Christina Medina

Dear New Mexico Department of Game & Fish,

As a long-time NM resident, I am appalled at this apparently poorly-thought through proposal. I count on my state to do better than this, and oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Maryann Staron

Dear New Mexico Department of Game & Fish,

As a former resource planner, I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department does not have a satisfactory science-based count of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

In addition, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades and their impact on bear habitat. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing human encroachments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Jane Love

Subject: [EXTERNAL] Reject the new bear and cougar quota!
Date: Monday, August 14, 2023 11:48:37 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Department of Game & Fish,

Please do NOT increase the quota for killing cougars and bears.

1. Top tier predators have crucial roles in the ecosystems! Please see the extensive studies done at Yellowstone and at other wilderness parks around the world: All life "below" the apex predators is affected, right down to reduction of plants such as grass (ranchers won't be happy!) and trees, which provide shade to streams and keep them from evaporating. This happens because there's a cascade effect from having far too many of the animals the cougars and bears and wolves would normally have been eating. Grasses died off, barren areas began appearing, and young trees could not achieve full growth because of too many herbivores, because there was no apex predator eating them to maintain nature's balance. EVERYTHING was affected by having not enough apex predators to balance out the smaller creatures' reproduction rate. Nature knows how to balance everything, and we need to stop messing with it, we only mess it up. We need streams that can flow water, we need grasses and trees. I've also lived in NC where there were too many deer because they had too few apex predators - all the deer were very small and scrawny, and then after a while in that shape, a disease came into them which was even worse. To have healthy deer and elk for our hunters whose families rely upon the meat, I saw firsthand that we must have apex predators to thin them out.

2. The proposed law makes no specifications as to how many can be killed, thus opening them all to extinction. (Who the heck wrote this law? Betting \$\$\$\$ is involved. Anybody knows laws need to be specific.)

3. We also should not be lengthening hunting season for bears in some areas - there are very sound scientific reasons for limiting the season. Don't go against science.

4. Allowing elk and deer hunters to opportunistically shoot bears and cougars is just ridiculous - those hunters are not scientists who have studied the delicate ecological balance in their region, so they have NO IDEA how much damage they are doing when they randomly kill bears and cougars.

Your department's proposal also gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution.

1) Reduce the hunting quotas of these two ecologically critical carnivores.

2) Maintain the current lengths of their hunting seasons.

3) Prohibit the use of hounds in bear and cougar hunting, which is also cruel and unnecessary, not to mention barbaric. We should be past that by now.

Thank you.

Sincerely,
Leslie Britt

Date: Wednesday, August 16, 2023 4:27:30 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Good afternoon I would like to write in and let you know that myself and my husband are both Put in for the big game hunt draw every year purple deer and elk and sometimes Other big games species. And I wanted to share our opinion about removing Predatory hunts like bear and mountain Lion. Predatory hunts are so important to Our ecosystem and the management of big game without these hunts the entire ecosystem I am trying to say the entire ecosystem Will become unbalanced and there will be a number of problems that follow when there Are too many predatory animals not only does the big game management suffer but also the livelihood of those who like to utilize New Mexico State parks. I urge you to not only leave the predatory hunts be but to Continue to listen to the advice of the experts and Monitor the amount of tags that are issued each year for these hunts.

Most Respectfully,
Jesse and Cherie Rios

NMDGF,

I have read the Proposed Changes Summary for the Bear & Cougar Rule. All the proposed changes appear to have sound science backing them, citing ecological and biological changes on the landscape that warrant increased harvest of both species in specific locations/contexts, as well as accounting for acquisition of new WMA property. I am support of all the proposed changes.

Thanks for your work,

Canyon Young

As a multigenerational New Mexican- I oppose trophy hunting of our large predators. I believe that especially with growing loss of habitat, the increased lack of water and hotter temperatures, that these species populations will be increasingly strained. We don't need more hunting.

Please consider decreasing quotas or at the very least, keeping them the same.

Respectfully

Evalinda Walrack

Dear New Mexico State Game Commission,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and I support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, I believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

I respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,

David Rios MD

Dear Commissioners,

It's crucial to remember the broader context when it comes to wildlife management in New Mexico. The interconnectedness of ecosystems means that decisions made regarding the bear and cougar rule have far-reaching implications. Given this, the science-based insights of experienced biologists should guide us. Let the hunts continue!

Dear Commissioners,

In the vast realm of wildlife management, staying grounded in research and tradition is key. New Mexico's proposed changes to the bear and cougar rule are a testament to this approach, reflecting both the state's rich hunting heritage and the latest scientific insights. This balanced perspective ensures that New Mexico's wildlife remains a shared treasure for generations to come.

Sincerely,
Brian Bielby

Dear Commissioners,

Wildlife management is not a popularity contest. The charge to manage our game populations to provide public recreation and food supply is essential to the commission's responsibilities.

Hunters have supported game management in our state for generations. The license fees and excise taxes they've willingly paid over the decades are responsible for the flourishing game populations that anti-hunters would now seek to protect from the very hunters who have nurtured them.

Sincerely,
Jeremy Hagen

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Predator management is vital to maintain a healthy habitat and environment in our forest. News of bears and cougars roaming our neighborhoods seeking easy prey like our pets is becoming more common. I also heard of a possibility of not allowing hunting hounds in NM. This will also be detrimental to our outfitters, causing unsuccessful predator hunts and harvesting numbers to decrease. We need to manage our game, especially predators.

NM is known for our great hunts, don't let uninformed extremist take that from us.

Sincerely ;

Tina Joy

New Mexico State Game Commission Members,

Please adopt the proposed rules drafted by New Mexico Department of Game and Fish biologists that will allow continued hunting of bear and cougar. Please follow the responsible predator hunt programs and the scientific management proposal submitted by game department biologists--please do not be influenced by the anti-hunting groups many of which are from outside New Mexico.

Hunters and fishermen are uber conservationists, good stewards of the land and resources, they follow rules and respect scientific research concerning game management while supporting responsible hunting programs as you should as well in your capacity on the New Mexico State Game Commission.

Thanks
Dan

Dear NM game and fish and all other parties involved.

While I am not a resident of NM I do visit and recreate there often.

I am 100% in support of science based predator hunting (even though I have not hunted bear/cougar myself yet).

We need to ensure it's present and regulated by fish n game agency that is based on science and facts.

I hope to get a chance at hunting bear or cougar in NM in near future.

Thanks

Roman

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Please reconsider the policy to allow more hunting of bears and cougars.

A better updated plan to manage our state's wildlife needs to be established to not allow MORE killing of an already stressed species of wildlife trying to adapt to recent fires, drought and change of habitat.

Killing them is not the proper way I want to see our state manage wildlife. We all have the right to exist.

Please say NO to allowing any kind of hunting of bear and cougar in this state. Colorado doesn't allow it. Perhaps our state game and fish needs to be educated on other methods of wildlife management and get out of the wild west mentality of allowing hunting of our valuable wildlife.

Hunting in this day and age is simply a sport and with all the technology these hunters have in their hands it's just a brutal one-sided game that's allowed to be played with our wildlife.

Opening up more opportunity to hunt bear and cougar is not about management but about allowing hunters to have at it and kill our wildlife. It's simply wrong.

Thank you, Felicia R. Trujillo

Subject: [EXTERNAL] Revisions to the Bear and Cougar Rule (19.31.11 NMAC)
Date: Sunday, August 6, 2023 6:53:30 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

My name is (Dr.) Mark Mattaini. My doctoral education emphasized databased, statistical, scientific analyses—work I continue to do as an emeritus professor for the University of Illinois Chicago while living here. I currently in Laguna Pueblo (I have lived in ten states, including almost a decade in Alaska). I am an active board member of the New Mexico chapter of Backcountry Hunters and Anglers, and a monthly donor to Defenders of Wildlife, thus expanding my perspective. I am writing to support the modest revisions proposed by the NMDGF for the Bear and Cougar Rule.

I have followed the work of the NMDGF since beginning to move to New Mexico over 20 years ago, and have attended Game Commission Meetings since 2020. I also regularly examine documents produced by the NMDGF. In developing this statement, I have also drawn on research and policies from multiple states (e.g., Colorado, Alaska, Washington, and Minnesota), and professional journal publications. The advancing technologies used by the NMDGF are consistent with research and practice across the most relevant areas in the United States and much of Europe. I find their research and analyses technically excellent, thoughtful, and well-grounded in the geography of our state. Their recommendations are supported by the data. No measure is perfect, of course, but the combination of non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and traditional measures where appropriate are safer and less disruptive to the animals, while also limiting costs.

30 years ago, a proposal by Cleveland Amory in the Sierra Club journal suggested that justice demands that “all animals will not only be not shot, they will be protected not only from people, but as much as possible from each other. Prey will be separated from predator, and there will be no overpopulation or starvation because all will be controlled by sterilization.” I cannot imagine a proposal less consistent with the natural world to which all animals are adapted. Ethical hunters engage nature in ways that are as much consistent with historical development of humans and animals up to the present—ways that I view as much more respectful and less traumatic than the ways domestic animals (and even plants), are grown under constraint, and killed to feed most of American society. Ever so, we must continually examine hunting practices, for example, in considerations of what genuinely constitutes fair chase, and is consistent with the North American Model of Wildlife Conservation. I believe the proposals offered by the NMDGF to be consistent with this framework. I therefore fully support their recommendations as prepared for the Game Commission.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Stop rule 190 bear hunting and lion hunting with hounds is a huge tradition and the only way to 100% decide if you want to harvest that animal after it's treed. People that hunt bears and lions without hounds have no sure way to sex the animals to help conservation with sow and female lion population for the next generations of hunters. Houndsmen do care and for most it's a way of life.

Subject: [EXTERNAL] Rule change
Date: Thursday, August 17, 2023 3:56:23 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The states predator population is already a problem and was even before the trapping ban. The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example. One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise. I have trapped most of my adult life and lost that, please don't take this away.

Subject: [EXTERNAL] Rule making against allowing hounds.
Date: Friday, August 18, 2023 3:34:03 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Anti-hunters haven't the slightest clue as to the logistics of a Bear or lion hunt.

The fact that hounds are used makes no difference in the grand scheme of things. The use of hounds is the safest way to control the predators, ie. Lions and Bears.

Ranchers have suffered many a loss of cattle, sheep, goats and horses due the overrun of predators that roam our public and private lands.

The current policy our state uses is well thought out and fairly enforced. Any threat to our current law is a threat to our ranchers' livelihoods.

Hunters and landowners need to stand together to preserve our rights as hunter and landowners.

The unfortunate loss of a pet can be avoided with proper handling of the animal.

When trained hounds are released into the wild for lions or bears, the handler controls every move of the pack. Thus the safety of the hounds are always at the forefront of the mission.

Anti-hunters have no business trying to dictate how I, or anyone else, chooses to hunt or fish in the state of NM.

Our hunting regulations are very stringent already and for good reason. Panels of educated people have put forth many efforts in preserving our state's wildlife and eco system.

Non participating entities should NOT have a say in the way we currently operate and govern the traditions of our great state.

New Mexicans, stand strong against outside non-participants, when our rights are being attacked.

Respectfully,

Mike Estrada.
NM lifetime resident.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I love NM and have visited often. It is an enchanted state except for wildlife and dogs.

Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.

Your proposed rules recommend raising the kill quotas for bears, extending the bear hunting season, and continuing indefensibly high kill quotas for cougars.

Please reconsider your proposals for many reasons. These animals deserve protection. Game and Fish has not provided sufficient or coherent information about bear or cougar populations that allow the public or even wildlife biologists to judge whether their recommendations are sound.

Please reconsider.

Thank you for listening.

Subject: [EXTERNAL] Running hounds on large predators
Date: Wednesday, August 16, 2023 9:12:25 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I'm a houndsman from Pennsylvania, who is PRO HOUND HUNTING, and also enjoys the pursuit of game with my dogs. I look forward to being able to chase game across the US when I retire. With the hopes of looking up a pine tree or on a cliff edge at a Cougar or Bear. Running these game animals is very enjoyable and rewarding. It gives sportsman the chance too better assess the trophy and decide if it's one they want to take or let go.

I think taking the option of hunting hounds on these game animals is going to take a big hit too the hunting economy within the state. It will also allow the predator population too expand further then the carrying capacity of the environment too allow which in turn will hurt the Elk and Mule deer Whitetail populations. There too it will be more common for tourists to encounter bears and cougars with the possibility of injuries or death.

Sincerely,

Thomas Johnson

Dear Commissioners,

Please allow the qualified biologists and other Game and Fish professionals to continue to do their jobs. New Mexico's wildlife needs our help in order to survive and not face slow and excruciating deaths by an already over populated large predator population.

We need to be able to control the populations of all large predators in New Mexico and the best way to do that is to continue to allow hunting with hounds or any other method deemed necessary by the professionals.

Ending hound hunting and other forms of predator control will ensure diminished populations throughout the state. It is your responsibility to maintain balanced and healthy populations of all wildlife, not just large predators.

Sincerely,

James Willems

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Dear New Mexico State Game Commission,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and I support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, I believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

I respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,

Brad Green

Commission,

I encourage you to “listen to the science” with your newly proposed bear/cougar management rules. Don’t bend to the political pressures of interest groups using the public comment to make it appear that the general public is against bear and cougar management.

Hunting, especially of predator species, is an important part of maintaining a balanced, sustainable population of wildlife in our wonderful state. The people best suited to make the recommendations for target populations are the wildlife biologists who’s job it is to study the numbers, not militant organizations who are catering to their donating members.

As an avid outdoorsman and father, I sincerely hope you base your decision for predator management off the scientific data, not some campaign by interest groups to reduce hunting access.

Dear Commissioners,

Keep the bear and cat hunts! It's essential to appreciate that every region has its unique ecological challenges and solutions. Drawing parallels with other states without understanding the underlying dynamics can be misleading. For instance, the consequences faced by states that banned certain hunting practices should serve as valuable lessons. Collaboration and understanding between various stakeholders can lead to informed decisions that are beneficial in the long run.

Sincerely,
Tadd Olson

Dear Commissioners,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

We respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Sincerely,
cody kress

Subject: [EXTERNAL] Scientific approach to why hound hunting is good for wildlife
Date: Tuesday, August 15, 2023 10:45:56 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear state of New Mexico,

Hear are some of the reasons you should consider keeping a hound hunting season for bear and cougar. One of the main reasons are it is very ethical way of hunting. By treeing a bear or cougar you get a good look at the animal. Which gives you a good look at the age and sex of the animal. So there for there a far less accidental killing of an immature animal. Which actually helps the overall health of the predator population.

Reason number two: by keeping the predator population in check increases the health of mule deer and elk populations.

By managing the predator population to a good balance helps the deer and elk thrive better. It also then in return make the predators that are their much healthier. with more deer and elk it allows more opportunity for tags for residents and non resident hunters. Which help the state agency rase money.

Reason number three: if the predator population goes unchecked for to long it will be detrimental for the overall health of the species.

If the predator population goes unchecked and swings where there are more predators than prey species eventually they run out of food and have a massive die off from diseases. In that mean time they are killing of all the deer and elk populations. Which means the less deer and elk . the less tag are gonna be available for resident and non resident hunters. In return means the less money that state agency brings and the less money that is spent in the towns the hunters pass through on there adventures.

If y'all actually read all this I surely do appreciate it and please take a good look at the science behind it. It's very important to manage the predator population healthy balance. I do speak for most hounds man and we love running the game and treeing them and freeing them to live another. Please don't judge us based off one two bad apples in the bunch.

Thank you, sincerely from

Jacob wolfe

Dear Commissioners,

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The state's predator population is already a problem and was even before the trapping ban. The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example. One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Sincerely,
Chance Lee

Subject: [EXTERNAL] Statement of opposition to increase in hunting quotas for New Mexico bears and cougars
Date: Sunday, August 6, 2023 12:49:54 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear State of New Mexico Department of Game and Fish;

This message is to express opposition to your department's current proposal to accelerate hunting take of New Mexico bears and cougars. My perspective as a New Mexican is that wildlife is a resource for all citizens of the state, and not a source of entertainment or sport for a select group of trophy hunters. Your department has not spent sufficient time and resources to understand the ecosystem value of New Mexico bears and cougars, and cannot project the ecosystem effects of accelerated take, especially given the multi-decade drought we are experiencing and its effects on animals throughout the state.

I object to the funding basis for the Department of Game and Fish, which relies on sale of hunting licenses to fund the department. The obvious conflict of interest between managing wildlife for sustainable populations and the department's need to fund its regular operations leaves DGF with no credibility when seeking to accelerate hunting take.

Sincerely,

Barbara Judy

Dear Commissioners,

I'm for keeping the bear and cougar hunts. One of the key strengths of New Mexico's wildlife management lies in its adaptability and foresight. Suggestions such as requiring hunters to utilize all edible portions from their hunts are not just progressive but ensure that hunting remains sustainable and respectful in the state.

Sincerely,
Jilliane Zito

Dear Commissioners,

I'm calling for support of the bear and cougar hunts! The longstanding tradition of hunting in New Mexico brings numerous benefits, from conservation funding to family bonding. I believe it's essential to recognize these contributions and protect our state's hunting heritage. Adding provisions against game waste can further elevate the perception of hunting.

Sincerely,
Sue Tidwell

Dear Commissioners,

Responsible game management is essential, not just because it's tradition, but because it's the law. New Mexico's legislation clearly underscores the importance of maintaining a sustainable game population. Adhering to scientific strategies, as proposed by NMDG&F, aligns perfectly with this mandate. Let the hunting of cougar and bear continue.

Sincerely,
James Jubran

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The state's predator population is already a problem and was even before the trapping ban. The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example. One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Sincerely,
Nathan Younkin

From: [Ramona Harrison](#)

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

It's undeniable that hunting plays a significant role in wildlife conservation. From the funds generated through licenses to the active role hunters play in managing and monitoring animal populations, their involvement is essential. Abolishing the use of hounds and general bear and cougar hunting, based on non-scientific arguments, can result in unintended and detrimental consequences to ecosystems.

Sincerely,
Ramona Harrison

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

Wildlife management is not a popularity contest. The charge to manage our game populations to provide public recreation and food supply is essential to the commission's responsibilities.

Hunters have supported game management in our state for generations. The license fees and excise taxes they've willingly paid over the decades are responsible for the flourishing game populations that anti-hunters now would seek to protect from the very hunters who have nurtured them.

Sincerely,
Cameron Gatto

Greetings:

My family and I live on the edge of the Gila National Forest. Below is information and data that clearly can guide the rules for these amazing mammals.

- 1- Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.
- 2- Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.
- 3- Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.
Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless and cruel.
- 4- The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.
- 5- NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.
- 6- Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited. Moreover, given the newness of these studies, they are only a snapshot of the current population in a given area. We do not yet have long-term on-the-ground field studies of bear and cougar populations throughout the state that could indicate population trends. Absent good data, the department should be exercising great caution with managing the population of bears and cougars.
- 7- Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for 'trophies' and recreation. Ask NM Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar

and bear hunting.

Thank you for your consideration of the lives of both bears and cougars on our lands of NM.

Hello,

I am writing today to oppose the proposed allowance. Removing legislation and protections has always resulted in worse than anticipated impacts to the species due to over-harvesting and increased poaching that these rules allow for. Cougar and Bear are the only predators we have to help reduce the deer, elk, feral cow, and feral horse populations, which, in regards to the last two are actually in need of management. I highly recommend that instead of pursuing this short-sided, money grabbing rule, you retract the proposed rules.

Thanks,

Chris

Greetings:

I am writing to strongly oppose continuation of allowing hunting of cougars and bear in New Mexico. There should be a moratorium on hunting these animals until there is a rigorous, fact-based assessment of the effects of hunting these animals. This assessment should include effects on animal populations, actual impacts on livestock, and economic impacts.

There is a positive impact on tourism of feeling that wildlife and the rest of the natural world is intact in New Mexico. It could be - and should be - assessed, as it may well dwarf the small amount of permit and license fees generated by hunting, which benefits only a tiny number of hunters compared to the vastly larger number of New Mexicans and tourists who visit New Mexico and want to have unspoiled beauty.

The assessment should also consider animal cruelty. Hunting is no longer a hunter walking in the forest - current methods are both high-tech and barbaric. I feel that current hunting methods are more related to cockfighting in terms of cruelty. Moreover, it is even more cruel, as bears and cougars have much more consciousness than chickens. Cockfighting has appropriately been banned. Bear and cougar hunting should be similarly evaluated and approached.

Please consider at least a moratorium if not an outright ban on hunting mountain lions and bears.

Sincerely yours,

Dear New Mexico Department of Game & Fish,

I completely oppose the New Mexico Department of Game & Fish's insane proposal to kill even more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Robert Fischhoff

Dear Department of Game and Fish,

I am strongly opposed to increasing the number of bear and mountain lion hunting permits in New Mexico, especially for trophy hunters. This is an offensive activity (certainly not a sport) and should be prohibited both in New Mexico and nationwide. Aside from that, the proposed changes will harm our bear and mountain lion populations who are already facing grave threats from climate change, fragmented habitat, and motor vehicle collisions. There is no scientific review or justification of this proposal and it seems to be solely meant to benefit hunting interests. Many of us either live in or moved to New Mexico because of its rich natural beauty and wildlife, including bears and mountain lions.

Instead of seeing bears and mountain lions as a revenue source through hunting permits, the Department of Game and Fish should be working with the scientific and environmental communities to more accurately assess the bear and mountain lion populations in our state and determine ways to help them flourish. Increasing hunting quotas is NOT the way to do this!

It's time to end the age-old antagonisms towards these animals and instead find ways to coexist in a healthy environment for all.

Please reject this offensive and inappropriate proposal.

Sincerely,

Richard Brown

Dear Commissioners,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

We respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Sincerely,
Greg Meisner

Department of Game & Fish,

Hunting is under attack within the state!

We continue to watch our heritage being washed away by groups that are constantly looking for an agenda. Many of these groups have the majority of their membership that has never set foot in the forest, woods, or wilderness yet they are allowed to dictate policy. This dictation of policy is not through science but based on empirical emotions. If you continue to allow this behavior, you too will find yourselves out of a job. The department has employees (biologists) that evaluate the wildlife populations, harvesting, and environmental conditions in making sound recommendations for not only conservation. If the state is not going to follow their research then why are we employing them? I could go on about this topic, but why when you have all the evidence required to make the right decision...

I support the scientific management proposal submitted by game department biologists and the continuation of scientific predator management programs in our state.

Regards,

Joseph T. Griego,
Hunter, Outdoorsman, & American Patriot

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The states predator population is already a problem and was even before the trapping ban. The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example. One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Dear State Game Commissioners:

Your professional big game biologists have presented you with a conservative, science-backed proposal for cougar and bear hunting over the coming four-year span of the rule. Their recommended modifications to the existing rule are modest, and the changes' effects on the harvest figures for both species will be nominal.

As a Native New Mexican with long experience in wildlife conservation, I personally support the Game and Fish Department's recommendations as presented, and I urge you to do the same. You can vote with confidence: Contrary to the dire suppositions you are receiving from some quarters, both species are thriving, and will continue to thrive, under this management regimen.

Thank you for reading.

Dear Commissioners,

We need to keep the management of lions and bears the in the great state of New Mexico...management of predators is key to keep the ungulate population flourishing. The best tool to manage these predators is the use of hounds because it allows you to age and sex the animal with no guessing and also allows you to be more selective on the animal you want to harvest. Please do not change anything on the lions and bear hunts.

Sincerely,
Jarrod Fischer

Dear Commissioners,

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The state's predator population is already a problem and was even before the trapping ban. The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences. California is the perfect example. One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

Dear Members of the New Mexico State Game Commission,

I am writing to express my strong support for the continued practice of bear and cougar hunting, including hunting with dogs, as approved by state biologists. As an avid outdoors enthusiast and conservationist, I believe that responsible hunting plays a crucial role in maintaining healthy wildlife populations and preserving the delicate balance of our ecosystems.

Hunting, when properly regulated and guided by scientific research, is an effective tool for wildlife management. Hunting with dogs, in particular, has proven to be an efficient and ethical method for managing bear and cougar populations. The use of well-trained hunting dogs allows for more precise tracking and selective targeting, reducing the likelihood of accidental harm to non-target species. Moreover, hunting with dogs promotes responsible hunting practices by enhancing safety and minimizing the risk of wounded animals escaping and suffering unnecessarily.

In conclusion, I urge the New Mexico State Game Commission to continue supporting bear and cougar hunting. By doing so, we can maintain a balanced and healthy ecosystem, support wildlife conservation efforts, and uphold our cherished hunting traditions. Thank you for your dedication to the responsible management of our state's wildlife resources.

Sincerely,

Patrick Boyne

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Game Commission,

Neither bears, nor lions are endangered. Therefore, their population must continue to be managed by ethical hunting. Hound dog use, some people's heritage, is an effective way to locate these predators. It must not be infringed. I support the scientific management proposal submitted by game department biologists and the continuation of scientific predator management programs in our state. Thank you for your considerations.

From: [Alyssa](#)
To: [DGF-Bear-Cougar-Rules](#)
Subject: [EXTERNAL] Support for Hunting with Dogs as an Effective Method for Bears and Mountain Lions
Date: Wednesday, August 16, 2023 12:51:47 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To Whom It May Concern,

I am writing to express my strong support for the continued allowance of hunting with dogs as a legitimate and effective method for pursuing bears and mountain lions in New Mexico. As a responsible outdoors enthusiast and a supporter of conservation efforts, I believe that this traditional hunting practice should not be infringed upon due to its practical benefits for both wildlife management and safety.

Hunting with dogs has been a time-honored practice that dates back centuries and has proven to be a successful and ethical means of controlling predator populations. This method allows hunters to closely track and engage with targeted animals, thereby ensuring precise and humane kills. Additionally, hunting with dogs enhances the safety of both hunters and the general public, as trained hunting dogs contribute to better tracking and preventing the animals from entering populated areas.

Furthermore, the use of well-trained hunting dogs can lead to more selective hunting, minimizing the impact on non-target species. By allowing hunters to focus on specific animals, such as bears and mountain lions, the risk of unintended wildlife casualties is reduced. This targeted approach aligns with the principles of responsible wildlife management and helps maintain a healthy balance in local ecosystems.

In light of these benefits, I strongly urge the New Mexico Department of Game and Fish to maintain the right to hunt with dogs for bears and mountain lions. By preserving this method, you can ensure the continued effectiveness of predator population control and contribute to the conservation of these species. I believe that a balanced approach that respects the rights of responsible hunters while safeguarding the well-being of wildlife and the public is crucial.

Thank you for your attention to this matter. I trust that you will carefully consider the significance of hunting with dogs as an important tool for wildlife management and conservation in New Mexico.

Sincerely,

Dear New Mexico State Game Commission,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting with dogs as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

We respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,

From: [Dylan Anderson](#)
To: [DGF-Bear-Cougar-Rules](#)
Subject: [EXTERNAL] Support for Proposed Bear and Cougar Rule Changes
Date: Thursday, August 17, 2023 8:33:56 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Game Commission,

I am writing to express my **strong support for the proposed changes** to bear and cougar regulations, as well as my **unwavering commitment to science-based bear management** in our state.

As a lifelong resident of New Mexico and a current resident of Albuquerque, I engage in hunting activities within our beautiful state every year. I have participated in several bear hunts, valuing the accessibility of over-the-counter opportunities for pursuing big game locally. This endeavor holds a special place in my heart, not only for the thrill it brings but also for the unique landscapes it allows me to explore. Moreover, the sustenance provided to my family in the form of meat and tallow from these hunts is deeply cherished.

Research by Hristienko & McDonald (2007) underscores the upward trend in black bear populations throughout the continental United States [1]. This thriving population is, however, juxtaposed with the challenge of diminishing habitat due to urbanization and the convergence of urban-wildland interfaces. It becomes apparent that the expansion of black bear territories requires astute management.

A parallel concern revolves around elk populations, which have come under significant pressure due to factors like drought and habitat loss. A study by Quintana (2016) conducted in Northern New Mexico highlights an alarming observation: "the primary cause of death for [elk] calves across all years was black bear predation." This underscores the pivotal role that science-driven policies play in effectively managing both bear populations and their prey species within our state.

In light of these findings, I wholeheartedly endorse the proposed rule changes that embody science-backed bear management strategies. These measures not only address the challenges posed by thriving bear populations and their impact on other species, but they also ensure the preservation of our diverse ecosystem.

Thank you for your time and consideration. Your efforts in advancing balanced and informed wildlife management are greatly appreciated.

Sincerely,

Dylan Anderson

Hello,

I am writing to tell you that I am in support of all the proposed changes to the bear and cougar hunt rules and zones.

I also have a few comments of my own on additional changes which I think should be considered:

Make unit 26 and 27 into a separate bear hunting zone. These units are separated from the main Gila units by many miles of desert and to me seem to be a distinct population that is more connected to the Chiricahua's in Arizona and the mountains in Mexico. There is a healthy bear population in these units as I have witnessed for many years when deer hunting.

I think that additional population studies for bears should be done in Units 36 and 37. I have been hunting and hiking these units for 35 years and I think the current bear population is the lowest that I have ever seen. The lack of bear harvest in these units over the past several seasons is due to a lack of bears, not a lack of hunter effort.

Thanks for your consideration.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Removing the hunting of bear and cougar from NM will increase the population of both. The increased population of cougar will reduce the number of other game animals and increase the chances that "hiker" will appear on their menu. Increase of bear population will increase the number of bears in residential areas as they are pushed to forage for food.

We should be thanking our hunters for working with the NM Game and Fish to help maintain the wildlife populations in NM at sustainable levels.

Dear New Mexico State Game Commission,

I am a resident of New Mexico and avid outdoorsman. I also hunt big game in New Mexico.

I support the scientific management proposal submitted by game department biologists and the continuation of scientific predator management programs in our state. If the state curbs the predator management programs, fewer numbers of big game will be available, which then can have an adverse impact on state revenues gained through hunting and outdoor activities.

For example, I would be more inclined to hunt in a neighboring state if I knew my chances of tagging big game were minimized. I know of many others who feel the same way as I do. I also know that larger numbers of big game, and quality big game, attract hunters from outside of the state, which is a major source of revenue.

I love New Mexico and all it has to offer in terms of hunting and fishing. I ask that we continue to embark upon the scientific predator management programs that will continue to allow our citizens, and even non-citizens, the opportunity to hunt in the state.

With appreciation,

Ken Quintana

There is no justification for cutting out the hunting of bear and cougar. Neither species is in any danger and in fact are too common in many areas. Both species can be dangerous for humans when they lose their fear of humans, and when they become overpopulated. These are not warm and friendly animals but are large carnivores and regulated seasons are necessary to keep their populations under control.

The anti-hunters are the dealing with pure feel-good emotion, not common sense.

I'm writing to show support for the use of hounds and trapping as tools to help control predator populations in New Mexico. I have personally experienced how out of control predator populations have had a massively negative impact on our already low Mule deer numbers throughout the state. I am adamantly opposed to any rule changes that negatively affect the use of hounds or trapping as a conservation tool. Houndsmen, houndswomen, trappers and hunters are an invaluable resource to help control the predator problem within our state and across the nation. Best of all, they pay for the right to help through the revenue of hunting and trapping licenses and habitat stamp fees. Imagine that, a solution to a huge problem that actually pays you to use it, saving taxpayer revenue in the process! We can no longer allow "feel good" emotional idealism to rule over common sense, biologically proven conservation practices, when it comes to the health and welfare of New Mexico's diverse wildlife and beautiful wild places! My family, friends and I are all taxpayers and we all vote pro-hunting, pro-trapping and pro-scientifically based conservation!

Thank you for your time and consideration, -Larry Carson

I know that you have received several emails requesting that you abolish the use of hounds and Bear / Cougar hunting in general. Considering our state has lost public land trapping, getting rid of hound hunting is a terrible idea. The states predator population is already a problem and was even before the trapping ban.

The use of hound hunting is essential to many ranchers to reduce the predator populations and instill a healthy fear of humans. Every state, without exception, that has banned hounds has suffered the consequences.

California is the perfect example.

One of the biggest lessons learned with the trapping ban is that compromising with anti groups does nothing but give them momentum. When the game department tried to bring trappers and anti groups together, trappers tried to find common ground to no avail. I beg you, please do not compromise.

I support the use of hounds for bear and cougar hunting in New Mexico. The lack of support comes from misunderstanding the respectable men and women who partake in this sport, and their mission. I've seen first hand the passion for the dogs these individuals put forth as well as the pursuit of the game they love and respect. These animals are some of the most elusive animals to pursue and hounds are one of the only ways to properly manage their numbers. Please take into consideration all the men and women who have such drive and passion for this sport, I've seen more bears/lions be let go after being treed than I've seen harvested. Why? Because the respectable hunter in this sport doesn't want to see bear and lion numbers plummet, they want to take a few mature animals out of the population. But mainly they want to see the dogs as they work in the wilderness, and enjoy the moments that have made hound hunting so special for generations.

Maybe everyone needs to take a break and watch *Where The Red Fern Grows*

Dear New Mexico State Game Commission,

I am a life-long New Mexican and grew up hunting with my dad in southern New Mexico beginning in the early 1970's. I trust the science behind changes the Game and Fish are proposing. Besides the science, I spend a lot of time in the field. Bear and cougar are alive and well in New Mexico!

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

We respectfully request that the State Game Commission prioritize the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/trail cameras, GPS collars, and other traditional measures.

Respectfully,

Jeff Young

Hello,

I am not a hunter and the only animals I have shot with a rifle are ones that were sick or injured. I'm a livestock manager working on a large leased ranch in New Mexico and delight at every cached lion kill, bear seen ambling across the road or bathing in a drinker, or lion stirred from lazing in the morning sun. I have no personal interest in killing these animals for meat or sport. But I am writing to **support** the proposed rule changes for cougar and bear population management. Predators belong, and part of ensuring they have a place into New Mexico's future means looking to science based data to determine how we interface with and manage their populations.

Respectfully,

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

I commend the New Mexico Department of Game and Fish biologists for their work on the bear and cougar rule. I support their proposed changes. The proposed changes in many instances reflect the success of game department management practices and resulting increased populations.

The longstanding tradition of hunting in New Mexico brings numerous benefits, from conservation funding to family bonding. I believe it's essential to recognize these contributions and protect our state's hunting heritage. Adding provisions against game waste can further elevate the perception of hunting. The game commission should take some important steps to protect our state's hunting heritage from criticism from non-hunters. During the last legislative session a bill failed to pass that would have required hunters to remove the edible portions of bear, cougar and javelina from the field. Enacting such a requirement would do much to head off anti-hunting sentiment.

Thank you for the opportunity to comment on this rule. I appreciate this commission's commitment to securing the future of hunting and conservation in the state.

Sincerely,
Ryan Schroeder

Subject: [EXTERNAL] Supporting Sustainable Wildlife Management - Considerations for Bear and Cougar Hunting Seasons
Date: Wednesday, August 16, 2023 8:05:18 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Sir/Ma'am,

I trust this message finds you well. I am writing to express my perspective on the proposed changes to the bear and cougar hunting seasons in our region. As a conservation-minded individual, I believe that responsible hunting can contribute to both wildlife management and the overall health of our local ecosystem.

It is important to recognize that regulated hunting can play a role in maintaining balanced wildlife populations. Bear and cougar populations, if left unchecked, have the potential to increase beyond the carrying capacity of their habitats. This can lead to negative impacts on plant communities, as well as potential conflicts with human populations. Managed hunting can provide a tool to control population numbers and prevent such imbalances.

Scientific research supports the idea that well-regulated hunting can contribute to ecosystem health. Studies such as the work by Kunkel et al. (2017) published in the journal "Wildlife Society Bulletin" emphasize the importance of maintaining predator-prey relationships at levels that allow for sustainable coexistence. By selectively harvesting a portion of the bear and cougar populations, we can help preserve the health and stability of the ecosystem.

Furthermore, sustainable hunting practices can generate revenue that can be invested in conservation efforts. These funds can be directed towards habitat restoration, wildlife research, and education programs that promote a deeper understanding of our natural world. The potential benefits extend beyond ecological considerations, contributing to local economies and fostering a sense of connection between communities and their environments.

I encourage you to carefully consider the science-based arguments in favor of managed hunting. Responsible conservation strategies take into account the complex interactions within ecosystems, and hunting can be a valuable tool when applied thoughtfully and with strict adherence to regulations.

Thank you for your attention to this matter. I am open to discussing these perspectives further and sharing additional scientific references that support the arguments presented in this email. Let us work together to ensure a harmonious coexistence between wildlife and human populations.

Sincerely,

Randall Norred

Subject: [EXTERNAL] Tell NM Dept. of Game and Fish you OPPOSE the Current Bear & Cougar Rule
Date: Tuesday, October 24, 2023 2:23:06 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Dept Game and Fish,

Given the value of bears and cougars to New Mexico in providing ecological balance in the food chain, and attracting people to visit a state in which areas of wilderness and wildlife are left undisturbed by human manipulation, their kill quotas should be zero, rather than being increased. The proposed change is not based on solid numbers for habitat area or population variation over time for either species.

Bears and cougars are highly intelligent species with intrinsic value as part of the entire wild ecosystem. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, which creates social disruption that drives greater conflict with humans.

Both species have great ecological value. Bears spread more seeds than birds, and cougars leave leftovers for other animals, including raptors, enhancing biological diversity. Wildlife tourism (such as my annual visits to wild New Mexico!) bring in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars remains very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. While studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans and visitors to the state. Our state's wildlife deserves better. Game and Fish should apply the precautionary principle and cut, not increase, hunting quotas and seasons, to ensure healthy bear and cougar populations in their historic ranges.

Sincerely,
Leslie Kuhn

Subject: [EXTERNAL] Tell NM Dept. of Game and Fish you OPPOSE the Current Bear & Cougar Rule
Date: Monday, October 16, 2023 10:24:07 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Dept Game and Fish,

Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans. Our state's wildlife deserves better. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Subject: [EXTERNAL] Tell NM Dept. of Game and Fish you OPPOSE the Current Bear & Cougar Rule
Date: Monday, August 21, 2023 4:13:57 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Dept Game and Fish,

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

New Mexico is currently experiencing a 20-year “megadrought,” the driest period in the Southwest since 800 C.E., and a record heat wave this summer. Additionally, New Mexico’s two record-breaking fires in 2022 consumed over 666,800 acres of primary wildlife habitat. These cumulative effects of climate change will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates.

Bear and cougar population numbers are extremely hard to count accurately and the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for one year. This snapshot in time tells us nothing about the population’s growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the hallmarks of good science, which the people of NM deserve when it comes to wildlife management, are absent in the hunting rule proposed for bears and cougars. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Sincerely,
Laura Ramirez

Dear New Mexico Dept Game and Fish,

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

New Mexico is currently experiencing a 20-year “megadrought,” the driest period in the Southwest since 800 C.E., and a record heat wave this summer. Additionally, New Mexico’s two record-breaking fires in 2022 consumed over 666,800 acres of primary wildlife habitat. These cumulative effects of climate change will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates.

Bear and cougar population numbers are extremely hard to count accurately and the current health and sustainability of both species in NM are entirely uncertain. Date: Monday, October 16, 2023 1:30:05 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Dept Game and Fish,

Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans. Our state's wildlife deserves better. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Sincerely,
Molly Hayfield

There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates.

Bear and cougar population numbers are extremely hard to count accurately and the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for one year. This snapshot in time tells us nothing about the population’s growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the hallmarks of good science, which the people of NM deserve when it comes to wildlife management, are absent in the hunting rule proposed for bears and cougars. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Sincerely,
Susan Rose

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Dept Game and Fish,

Hi my name is Jess Clemens and I have been in the landscape business in Santa Fe since 1980. I have seen black bears and cougars in the wild only a few times on my many outdoor hikes and flyfishing trips in northern New Mexico. For me, they have GREAT VALUE alive, not dead. I have friends and family who are hunters and I respect that recreational pursuit. Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans. Our state's wildlife deserves better. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Sincerely,
Jess Clemens

Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Given the recent climate changes and the almost constant drought status for NM, it would be reckless to increase the kill quotas for these animals. Their numbers could naturally decrease radically by loss of food and habitat over the next few years. And starting the hunts earlier before they have had time to prepare for winter on scarce food sources will impact the survival of younger animals. Chase hunting should be eliminated completely. Your population studies are incomplete and inaccurate. An increase? in populations in one habitat area is not indicative of how the species is doing statewide. A long term study should be implemented, especially in areas of the state that have been more impacted by drought and wildfires.

Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

NMGFD is ignoring science, independent review by outside experts, actual review & study of total numbers of bears & cougars numbers & yearly deaths by humans; but also guilty of not taking into account that most New Mexicans don't own cattle ranches, or goats, or sheep, all of which are allowed by Fish & Game to infringe on bears & cougars natural habitat...nevermind the increasing number of humans moving into their habitat as well!

Lastly, Fish & Game must take into consideration the majority of New Mexicans who are vociferously against such an ignorant, arrogant, unscientific predetermination (based on nothing) to double or even just enlarge the allowable "hunting/trapping kill numbers" of bears & cougars.

Sincerely,

Date: Tuesday, August 22, 2023 9:09:05 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Dept Game and Fish,

As regards the current proposal, which I very strongly oppose, to raise the kill quota for New Mexico bears and cougars some intelligent thought needs to be given here because it seems very little, if any, logic is at play.

Bears and cougars are not likely to overrun New Mexico. Since there are no specific census counts on either of these animals how can increasing the killing of them make any sense at all? As it is they, like other wildlife, are now struggling with the effects the climate change crisis is inflicting on us all and which will undoubtedly worsen before, or if, things get better These issues alone must ultimately negatively affect the health of bear and cougar populations to survive as viable species.

Bears and cougars play a vital role in environmental balance--a fact which is not debatable. Furthermore, what is also a cold, hard fact is that human misuse and abuse of the natural world has caused much of the imbalance we are now experiencing. The hunting proposal revamp appears to cater to a specific segment of the population that enjoys what they call "hunting" but which, as practiced, is really blood sport. Wildlife is not expendable to suit humans. Increasing the kill quotas for bears and cougars by pandering to trophy hunters is unreasonable, cruel and irresponsible and should be neither encouraged nor promoted. Please do NOT do this.

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

New Mexico is currently experiencing a 20-year "mega-drought," the driest period in the Southwest since 800 C.E., and a record heat wave this summer. Additionally, New Mexico's two record-breaking fires in 2022 consumed over 666,800 acres of primary wildlife habitat. These cumulative effects of climate change will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates.

Bear and cougar population numbers are extremely hard to count accurately and the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for one year. This snapshot in time tells us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the hallmarks of good science, which the people of NM deserve when it comes to wildlife management, are absent in the hunting rule proposed for bears and cougars. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons

to ensure bear and cougar populations are not negatively affected.

Sincerely,
Linda Young

Dear New Mexico Dept Game and Fish,

I moved from Florida thinking New Mexico was more enlightened. I mean, it wasn't a high bar.

In 2015, Florida opened its first bear hunt in 21 years. They shut down the hunt after only two days, which racked up a shocking kill count of 306, including 36 lactating mama bears. Public officials resigned in shame.

Now panther politics will really drive you crazy. Those big cats have good noses, but the voting public are best at sniffing out greed on the landowning fat cats.

Don't be Florida. I mean, it's a pretty low bar.

Sincerely,
Sara Fitzpatrick

Dear New Mexico Dept Game and Fish,

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

New Mexico is currently experiencing a 20-year “megadrought,” the driest period in the Southwest since 800 C.E., and a record heat wave this summer. Additionally, New Mexico’s two record-breaking fires in 2022 consumed over 666,800 acres of primary wildlife habitat. These cumulative effects of climate change will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates.

Bear and cougar population numbers are extremely hard to count accurately and the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for one year. This snapshot in time tells us nothing about the population’s growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the hallmarks of good science, which the people of NM deserve when it comes to wildlife management, are absent in the hunting rule proposed for bears and cougars. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.

Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.

Both bears and cougars are mostly hunted using dogs that chase them, until they are exhausted, climb a tree, then are shot. Parts of the hunting community even find this practice contrary to Fair Chase, and surveys of general public have shown that the public opposes this method of killing for “trophies” and recreation. Please also consider broad public opinion and ban using dogs in this way to kill cougars and bears.

Sincerely,
Janice Evans

Dear New Mexico Dept Game and Fish,

Given the immense value of bears and cougars to New Mexico, and the lack of reliable population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social instability that serves as a catalyst driving more human/wildlife conflicts. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but unfortunately, population demographics for both bears and cougars is very limited. In fact, the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable goals and objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us little about long-term population growth rate or trends. Furthermore, there has also been no external review of those population estimates by independent, outside peers.

In short, the proposed rule is out of touch with both the principles of sound wildlife management science the conscience and wishes of the vast majority of New Mexicans. Our state's wildlife deserves better. The Department of Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure the long-term viability of bear and cougar populations in New Mexico.

Sincerely,
ANDREW V SANDOVAL

Dear New Mexico Dept Game and Fish,

Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans. Our state's wildlife deserves better. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Here in Los Alamos, we have managed to live with both bears and cougars. Sometimes it is necessary to euthanize these wild creatures, but most of the time, we live in harmony by taking reasonable precautions. I feel more in danger from drunk and inept hunters than from the game they are hunting!

Sincerely,
Melanie Shirk

Dear New Mexico Dept Game and Fish,

To kill indiscriminately is to wreak havoc on all species. Every day we learn more about the folly of our ways. Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. What do we teach our children by allowing trophy hunting? That our access to firearms gives us god-like power over other beings? Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans. Our state's wildlife deserves better. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Sincerely,
Janine Vinton

I have great respect for the officers carrying out their duties in the field in the face of so much controversy and division amongst their fellow New Mexicans. It cannot be an easy job, yet they remain responsive and helpful. The balance is so difficult to manage with this changing world of ours. Locally we were discussing the lack of large Elk bulls this year, noting that last years fire and destructive flooding have damaged habitat to the degree that all wildlife are struggling. Might be time to back off the harvesting and let nature work on things for a while. Respectfully, John David

Sincerely,
John David Blagg

Dear New Mexico Dept Game and Fish,

Good day from a friend in New Mexico. I would like to request that you read the below message in favor of reducing kill quotas with an open mind, and consider each and every point made by the author. We should be leading, not lagging, as a state in the push forward to better, more humane and sensical wildlife management.

Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans. Our state's wildlife deserves better. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Thank you, Mari

Sincerely,
Mari Rodriguez

Dear New Mexico Dept Game and Fish,

Dear Commissioners,

Please give the citizens of New Mexico policies we can take pride in, policies that nurture the populations and habitat of our legendary wild animals. Push to become a department regulated by sufficient data that will give New Mexicans a coherent view of our bear and cougar demographics.

Please do not increase the quotas for hunting bears and cougars. Let's keep the Land of Enchantment enchanting for people and native wildlife! Don't bring more shame to our state.

I agree completely with the Animal Protection of NM when it writes, "Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans. Our state's wildlife deserves better. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected."

Thank you for time. Blessings, should you agree.

Sincerely,

Linda and Bob Hull

Dear New Mexico Dept Game and Fish,

My sister-in-law, Dr. Kathleen Ramsay, provides care and rehabilitation for numerous bears and mountain lions every year in her veterinarian practice. How ridiculous to spend all that effort to treat injured wild animals only to have them hunted and killed.

Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Dept Game and Fish,

Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans. Our state's wildlife deserves better. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Sincerely,
Alice Trabaudo

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Dept Game and Fish,

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

New Mexico is currently experiencing a 20-year “megadrought,” the driest period in the Southwest since 800 C.E., and a record heat wave this summer. Additionally, New Mexico’s two record-breaking fires in 2022 consumed over 666,800 acres of primary wildlife habitat. These cumulative effects of climate change will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates.

Bear and cougar population numbers are extremely hard to count accurately and the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for one year. This snapshot in time tells us nothing about the population’s growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the hallmarks of good science, which the people of NM deserve when it comes to wildlife management, are absent in the hunting rule proposed for bears and cougars. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Sincerely,
Sue Farrington

Dear New Mexico Dept Game and Fish,

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

New Mexico is currently experiencing a 20-year “megadrought,” the driest period in the Southwest since 800 C.E., and a record heat wave this summer. Additionally, New Mexico’s two record-breaking fires in 2022 consumed over 666,800 acres of primary wildlife habitat. These cumulative effects of climate change will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates.

Bear and cougar population numbers are extremely hard to count accurately and the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for one year. This snapshot in time tells us nothing about the population’s growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

Dear New Mexico Dept Game and Fish,

Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Bears and cougars are highly intelligent species with intrinsic value independent of their benefits to humans. They are devoted mothers who spend up to 2 years raising their young and have complex social hierarchies that are easily disrupted through trophy hunting, creating social chaos that drives more conflict with humans. Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

Accurate population counts are vital to sound management, but obtaining an accurate count of either bears or cougars is very difficult. In fact, the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for a short time. Such snapshots in time tell us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans. Our state's wildlife deserves better. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for one year. This snapshot in time tells us nothing about the population’s growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

In short, the hallmarks of good science, which the people of NM deserve when it comes to wildlife management, are absent in the hunting rule proposed for bears and cougars. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Sincerely,

Dear New Mexico Dept Game and Fish,

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

New Mexico is currently experiencing a 20-year “megadrought,” the driest period in the Southwest since 800 C.E., and a record heat wave this summer. Additionally, New Mexico’s two record-breaking fires in 2022 consumed over 666,800 acres of primary wildlife habitat. These cumulative effects of climate change will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates.

Bear and cougar population numbers are extremely hard to count accurately and the current health and sustainability of both species in NM are entirely uncertain. There is no management plan detailing measurable objectives for these species. While a handful of studies were done to estimate population density in several areas, data was only collected for one year. This snapshot in time tells us nothing about the population’s growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

Dear New Mexico Dept Game and Fish,

As someone who lives in bear and mountain lion country, we have loved seeing the animals and their signs. But no more. We don't even find scat any longer. Also, as someone who remembers these same discussions from over 40 years ago, I am horrified to see that we still aren't considering the science and that NM policy when it comes to wildlife conservation is still driven by the interests of ranchers and hunters.

Now more than ever, the effects of climate change on these species, critical for the health of our ecosystems, must be taken into account.

As we've known for decades, bear and mountain lion populations are extremely hard to count accurately, and therefore, it is very difficult to determine the health of these species. Given the increased development in their habitat and the effects of climate change, these animals need more, not fewer protections, and less not more pressure. Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Sincerely,
Karen Menczer

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Dept Game and Fish,

Given the immense value of bears and cougars to New Mexico, and the uncertainty of habitat and population estimates for both species, their kill quotas should be reduced, not raised.

Both species also have great ecological value: bears spread more seeds than birds, and cougars leave more leftovers for other animals, enhancing biological diversity. Even from an economic standpoint, they are more valuable alive than dead since wildlife watching tourism brings in exponentially more money to our state than hunting or trapping.

And there is no management plan detailing measurable objectives for these species. The little research done tells us nothing about the population's growth rate or trends. There has also been no external review of those population estimates by independent, outside experts.

The proposed rule is out of touch with both the hallmarks of good science and the conscience of the vast majority of New Mexicans.

Game and Fish must apply the precautionary principle and cut, not increase, hunting quotas and seasons to ensure bear and cougar populations are not negatively affected.

Sincerely,
Matthew Wood

Dear New Mexico legislators

I'm writing to express my concern about the haste to promote Bear and cougar killings. Such elimination by NO mean will make certain business prosper, which is the idea behind the increase of slaughtering quotas.. .

In terms of problems, NM is better off by the help from bears and cougars in the fight to balance Nature's upcoming changes, than considering prospective benefits attached to hunting these carnivores.

Climate change IS a problem, it's already affecting NM, but the fact that many business people don't understand what's already going on on their lands turned them noisier than the voice of experts who work to keep NM wildlife healthy. Blaming animals for smaller profits is a shortcut deserving little consideration. .

- The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.
- NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.
- Thank your for your time
- Mari Elvi

Dear Commissioners,

I support the NMDG&F bear and cougar rule change proposal. The game commission should take some important steps to protect our state's hunting heritage from criticism from non-hunters. During the last legislative session a bill failed to pass that would have required hunters to remove the edible portions of bear, cougar and javelina from the field. Enacting such a requirement would do much to head off anti-hunting sentiment.

The game commission needs to do what it can to enact and support prohibitions on the waste of game including bear and cougar and other game species. Hunting bears and cougars is a longstanding tradition for many New Mexicans and people who travel to New Mexico from across the country. In addition to providing conservation funding, economic benefits from outdoor recreation, being a critical population management tool and bringing families together in the outdoors, the harvest of a bear or cougar provides countless nutritional meals for the lucky hunter and all those he/she shares the bounty with.

Sincerely,
Jamie Suchy

Dear Commissioners,

First of all, keep cougar and bear hunting! Hunting, as a conservation tool, needs continuous adaptation to ensure it aligns with both the welfare of animals and the changing perspectives of society. Suggestions like requiring hunters to remove edible portions from the field not only demonstrate responsible hunting but also can foster a more positive image. Proactive actions, rooted in both respect for wildlife and acknowledgment of hunting traditions, will go a long way in preserving this practice.

Sincerely,
Michael HOLT

Dear Commissioners,

Bear and cougar hunting has my support. It's essential to recognize the broader implications of abolishing hound hunting. The effects are evident in states like California. Our ranchers, who are deeply connected to the land, rely on such methods to maintain balance. I urge the commission to consider these broader ecosystems when making decisions.

Sincerely,
Philip West

Dear Commissioners,

Please support cougar and bear hunting. Emphasizing the role of experienced biologists in decision-making is vital. Their recommendations stem from extensive research and offer an unbiased, scientifically-grounded perspective. This isn't just about tradition; it's about making decisions based on empirical data and long-term sustainability.

Sincerely,
Doug Johnson

Dear Commissioners,

New Mexico state law that spells out the state's bedrock policy of wildlife management. The law calls for providing "an adequate and flexible system for the protection of the game and fish of New Mexico and for their use and development for public recreation and food supply, and to provide for their propagation, planting, protection, regulation and conservation to the extent necessary to provide and maintain an adequate supply of game and fish within the state of New Mexico." It is not only necessary and appropriate for NMDG&F to use scientific based management strategies including hunting to manage predator populations, but it is also the law.

Sincerely,
Brady Fincher

Subject: [EXTERNAL] The bear and cougar rule to protect New Mexican wildlife is WRONG
Date: Monday, August 14, 2023 12:26:22 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear New Mexico Department of Game & Fish,

The New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through the following is wrong:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
Mark Gall

It is distressing to learn that the state is considering allowing greater killing of bears and cougars. We know about how diminished wildlife populations are across the world as the result of development, drought, hunting and other factors. New Mexico is behind much of the country in failing to incorporate the values of New Mexicans who value wildlife, as well as failing to understand the tremendous economic value of wildlife viewing. I've been at the Bosque del Apache and watched tourists stop their cars to photograph a lone coyote crossing a field. People pay large sums to go to Africa or Latin America to watch wildlife. But after 50 years hiking around New Mexico I've never seen a mountain lion in the wild. I hope the Commission reverses course and allows our populations of bears and cougars to recover.

Subject: [EXTERNAL] Tomorrow's Commission Meeting re hunting
Date: Thursday, August 24, 2023 3:59:15 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Sirs, as you meet tomorrow I ask that you strike the proposed kill quotas for bears and cougars. The proposed kill quotas are far too large.

Given the current and anticipated impacts of drought, fire and subsequent habitat loss, and given that these apex species are both self regulating regarding their own numbers and an important element in regulation of ungulates, overhunting can cause serious harm and damage to their populations and the ecosystem as a whole.

Your attention to these concerns is most appreciated.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

There is some confusion as it is written, to allow an increase on draw permits for certain fall hunts. A deer or elk hunter can harvest a bear or cougar if the zone is open they hold a license. My input would be to put strict harvest limits, zone boundaries and start dates. This seems like a lot of details that each and every hunter will need to know and follow. I hate seeing bear and cougar wiped out for sport. Or any of them for that matter but putting meat on the table is different than killing just because you can!! I know many hunters having lived here for 69 years and know detail is not their strong point. I hope any rules are followed and infractions for deviating are strictly enforced with jail time and hefty penalties. This is an area where the animals are treasured. I accompanied my Dad to hunt our meat for the freezer and grew up strictly on wild game as that's all we had. But still I urge caution on these game rule changes. Thank you for a chance to comment. Subject: [EXTERNAL] Trophy Hunting
Date: Monday, August 14, 2023 9:30:42 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.

Killing bears and cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.

Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't apply the best available science, and ignore dangerously changing climate conditions. Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless and cruel.

The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.

NM has recently experienced severe drought and wildfires, both of which will almost certainly continue and intensify into the next four years. There is no indication that NM Game and Fish has accounted for these factors in their habitat or population estimates. Our climate trends weigh in favor of lowering kill quotas, not raising them.

Scientifically rigorous studies of bears and cougars have recently been conducted in New Mexico, but the areas where data exist are very limited. Moreover, given the newness of these studies, they are only a snapshot of the current population in a given area. We do not yet have long-term on-the-ground field studies of bear and cougar populations throughout the state that could indicate population trends. Absent good data, the department should be exercising great caution with managing the population of bears and cougars.

Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I am offering my comments for submission regarding Bear and Cougar Rule Proposed Changes.

1. I understand kill quotes for both bear & cougar have been unjustifiably high for many years. Given insufficient information regarding their populations, quotas should be reduced to protect a healthy gene pool.
2. With regard to severe drought and wildfires, how is this being accounted for in population or habitat estimates. Changing climate and fires are changing the landscape drastically. Hunting season should not be starting earlier in the season during summer high temperatures.
3. Where is a management plan detailing measurable objectives for both bear and cougar populations? How is this information being disseminated to the public?
4. I oppose the use of dogs for bear and cougar hunts. It is like shooting fish in a barrel and not a fair practice.
5. Trophy hunting does not aid in reducing human-wildlife conflict. The removal of “trophy” animals can disrupt the biological balance of hierarchy in the species, potentially contributing to more human-wildlife conflicts.

Thank you for this opportunity to comment.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Nex Mexico Game Commission members

We are concerned about the cougar- bear decimating tendency embedded in the new F&W proposal.

Killing Bears and Cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.

The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates. Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.

Both bears and cougars are mostly hunted using dogs that chase them, following their scent until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs, usually by using their electronic collar beacons as they keep the animal treed. When the hunter arrives at the scene, the hunter will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles. Surveys of the general public also show opposition to killing bears and cougars using these methods for 'trophies' and recreation. Ask NM Game and Fish to consider broad public opinion and adopt hunting rules that ban the use of dogs in cougar and bear hunting.

With due respect

Mari Elvi

Dear Commissioners,

Bear and cougar hunts need to be supported. We're witnessing the fruits of diligent and scientifically-sound management through the increased populations of various species. I commend the department's efforts and wholeheartedly support the proposed changes to the bear and cougar rule.

I live in Oregon. Due to a law change here, we are no longer able to bait bears or use hounds for hunting cougars. Both predators are thriving at the expense of our grass eaters - deer, elk etc.

Sincerely,
Anthony White

Dear Commissioners,

Hunting and trapping are a necessary tool for wildlife conservation. Bear and Mountain Lion management are important and should not be curtailed as proposed.

Conservation and wildlife management practices are an evolving discipline that depends on both scientific data and historical context. The changes proposed in the bear and cougar rule reflect a dedication to this balance. The significant contributions made by hunters, anglers, trappers, and recreational shooters, not just in New Mexico but nationally, cannot be overstated. Prioritizing the insights of dedicated department biologists ensures a sustainable and healthy future for all wildlife.

Sincerely,
Shannon Sheffert

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

I support the NMDG&F bear and cougar rule change proposal. The game commission should take some important steps to protect our state's hunting heritage from criticism from non-hunters. During the last legislative session a bill failed to pass that would have required hunters to remove the edible portions of bear, cougar and javelina from the field. Enacting such a requirement would do much to head off anti-hunting sentiment.

The game commission needs to do what it can to enact and support prohibitions on the waste of game including bear and cougar and other game species. Hunting bears and cougars is a longstanding tradition for many New Mexicans and people who travel to New Mexico from across the country. In addition to providing conservation funding, economic benefits from outdoor recreation, being a critical population management tool and bringing families together in the outdoors, the harvest of a bear or cougar provides countless nutritional meals for the lucky hunter and all those he/she shares the bounty with.

Sincerely,
Mark Walker

Subject: [EXTERNAL] VOTE NO ON EXTENDING CURRENT HUNTING LIMITS ON MOUNTAIN LIONS
Date: Sunday, October 15, 2023 12:34:56 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To Whom It May Concern:

Here's the main point: **PLEASE, DO NOT ACT TO EXTEND THE CURRENT HUNTING LIMITS ON MOUNTAIN LIONS (COUGARS).**

The state of NM is quite complex. We tend to be lauded for our natural beauty and artistic community and jeered for our bottom of the list standing when it comes to public education, etc. We just finished up a successful 51st Balloon Fiesta which continues to make us a "bucket list state destination." We personally have met some of the best human beings on the planet in this very state.

Meanwhile, students at local public high schools continue to have ridiculous access to guns that wind up shooting their peers. Across the world, Israel and Palestine are going at it among other world conflicts like say, Ukraine... Global warming is contributing to wild weather swings resulting in loss of life and property. And, Covid19 still looms. There is plenty to cry over and lament.

Can we at least agree on NOT decimating slowly and surely the mountain lions of our state by **NOT granting the extension of current hunting limits on these majestic animals? Can we do something peaceful for once?**

Keeping the faith...

Martha Glenn, David Tichnell and Conor Tichnell

Dear Commissioners,

History has shown us that hunters have played an invaluable role in the conservation efforts of regions like New Mexico. Their contributions, both tangible and intangible, have bolstered game populations and fostered a culture of respect for the wild. It's pivotal that we recognize these efforts and ensure that they aren't undermined. Bear and cougar hunts? I'm in full support.

Sincerely,
Erik Scarr

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear Commissioners,

Wildlife management is not a popularity contest. The charge to manage our game populations to provide public recreation and food supply is essential to the commission's responsibilities.

Hunters have supported game management in our state for generations. The license fees and excise taxes they've willingly paid over the decades are responsible for the flourishing game populations that anti-hunters now would seek to protect from the very hunters who have nurtured them.

Sincerely,
Doug Padilla

Dear New Mexico Department of Game & Fish,

I oppose the New Mexico Department of Game & Fish's proposal to kill more black bears and cougars through:

- 1) Making unspecified increases to hunting quotas.
- 2) Lengthening hunting season for bears in some areas.
- 3) Allowing elk and deer hunters to opportunistically shoot bears and cougars.

Your department has only a hazy notion of how many bears and cougars live in the state, since you estimate their population by extrapolating from limited study areas to much broader regions.

Despite these questionable numbers, your department's proposal gives no consideration to the effects the climate emergency may have on bear food sources and habitat. The climate emergency has been wreaking havoc on the habitat of bears, but this proposal doesn't acknowledge the persistent droughts that New Mexico has experienced over the last two decades. A study in Nature Climate Change revealed that the Southwest is the driest it has been since 800 B.C., making the bears' food and water sources increasingly hard to find.

The proposal also doesn't acknowledge the impact ongoing developments may have on habitat connectivity or how the use of hounds in hunting puts nontarget animals in danger and risks human safety.

Instead of killing more bears and cougars, the department should reject the bear and cougar rule and err on the side of caution by:

- 1) Reducing the hunting quotas of these two ecologically beneficial carnivores.
- 2) Refraining from increasing the lengths of their hunting seasons.
- 3) Prohibiting the use of hounds in bear and cougar hunting.

Thank you.

Sincerely,
julian laroza

Dear Commissioners,

I'm writing in support of the cougar and bear hunts. The intricate web of ecosystem balance is maintained through various tools, with wildlife management being a crucial one. This isn't about favoring one group over another, but about understanding the symbiotic relationship between hunters, the game, and the larger ecosystem. The investment, both monetary and in terms of conservation efforts by hunters, has played a significant role in maintaining flourishing game populations. The challenge is to ensure that these efforts are recognized and not undermined by misconceptions or unscientific arguments.

The wildlife of New Mexico is a resource which all residents and visitors have a right to enjoy. How are we going to enjoy it if you encourage the culling of bear and cougar populations?

Are you aware that a cougar was recently trapped in Rio Rancho of all places? Does this not indicate to you that heat and drought are forcing desperate conditions upon bears and cougars? It is your job to protect these animals and be aware of conditions which can lead to their decline.

What studies have been done to indicate that bear and cougar populations require culling? What studies have been done to give you an educated indication of the number of these animals in the state? What studies have been done to indicate how much income the state can accrue by allowing increased extermination of these animals versus potential tourist dollars which people spend to come to the state and enjoy its natural resources?

Hunters' right to kill animals does not surpass my right to see them in the wild.

Hello,

Del Oso. It's something I see all around New Mexico. Which means, of the bear. Arroyo del Oso, Casa del Oso, Mesa del Oso, Boca del Oso, and so on. Oftentimes, places are represented with a logo of a bear.

The Oso is one of the iconic symbols of New Mexican culture I think about, up there with kokopelli, the Zia Symbol, and the lobo. I was disappointed to see that the kill quota on bears is increasing in a state that holds the bear in such high regards.

It's a fearsome, yet beautiful creature that captivates anyone lucky enough to lay eyes upon them. New Mexicans should be doing all we can to preserve the livelihoods of these behemoths that hold a dear place in our hearts.

I am JT Mitchell of Albuquerque, NM and do not support the increase in bear harvesting totals.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

My name is Antoinette Reyes. I am a 15th generation New Mexican. Born in the Silver City area and now living in Las Cruces.

Unlike other game species, bears and cougars are not hunted for sustenance but for a trophy, much of the kill goes to waste and it is cruel for that reason. What was a good methodology eleven years ago isn't necessarily still a good methodology today.

Bears and cougars are extremely important to the integrity and health of ecosystems. They are also self regulating species. Killing larger, more established individuals increases possible wildlife-human conflict as it disrupts important bear and cougar social structures. They are territorial animals and if an individual with no history of conflicts is killed, younger and less experienced individuals can move into the now vacant Territory now opening up possible conflicts with the new less experienced individual. Aside from ignoring this basic fact about predator behavior from wildlife science, the hunting proposals lack scientific rigor and actually ignore well established science for emotional reasons that actually make any valid concerns worse.

The hallmarks of good science and respecting the history and culture of local communities when it comes to living in harmony with nature has been thrown out in favor of catering to out of state trophy hunters or in-plants that have moved to the area that lack an understanding of the region and the true needs.

New Mexicans deserve good science when it comes to wildlife management, a suggestion includes consulting with independent, outside experts to revamp the estimates and models used for this program. A lot has changed nationally in the last ten years when it comes to the scientific understanding and research that has been done on predators such as those in this rule. The science for the hunting rules for bears and cougars need to be revisited. Some of the concerns I had with the presentation given today include:

It does not appear much has been done to account for migration between zones through the hair follicle snare data. Not to mention that it does not appear much has been done to account for wildlife moving around and finding new homes in the post-fire data. The dept also does not mention why the population density multiplication factor is so high basically multiplying the hair snare study by 16-18 times.

However to end my comment I would like to thank the dept for keeping the female limit intact.

Subject: [EXTERNAL] You already know, or should know, the commentary below. Does it make a difference?
Date: Thursday, August 24, 2023 4:48:28 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

What gives with the killing mentality? What is it with the need to kill these animals who have a right to live, and who are part of our ecosystem? Do you know that worldwide, we have lost 60 - 70% of all animals in the last few years?

How can you continue to issue licenses to kill when there is no need to kill other than for fun? What is the NEED?

Are you aware of the decimation that will occur of already decimated populations?

How many times do you have to hear that this is bad, bad policy? Do you believe that bears and cougars can grow from seeds? Of course you don't. So why continue to issue licenses to kill? Do you not read the science? Do you not heed what climate change alone has done to habitat?

Bottomline, what about the cruelty and the barbarism? Or uou don't think this is cruel?

Given the uncertainty of habitat and population estimates of both bears and cougars, the quotas for both should be reduced, not raised. Kill quotas for both species have been unjustifiably high for many years.

Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species can self-regulate their own numbers. Therefore, erring on the side of killing fewer of these animals is not problematic. Killing too many can impact their populations for a long time.

Killing bears and cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting important bear and cougar social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.

Bears and cougars are extremely hard to count accurately, so Game and Fish should exercise extreme caution when calculating kill quotas, to ensure the populations are not negatively affected. Current proposals to raise the kill quotas are reckless, don't

apply the best available science, and ignore dangerously changing climate conditions.

Adding more bear hunting permits and starting the season earlier in the heat of summer will likely result in more bears dying. This is both reckless and cruel. The hunting proposals lack scientific rigor. There is no management plan detailing measurable objectives for these species, and no attempt to address the uncertainty of the population estimates.

Transparency is so lacking that the public has no way of knowing how the populations for either species have been derived. And there has been no external review of those population estimates by independent, outside experts. In short, the hallmarks of good science, which the people of New Mexico deserve when it comes to wildlife management, are absent in the hunting rules proposed for bears and cougars.

Surely these statements of what is true have come across your desk before.
Please do the right thing and stop all quotas, all this needless destruction of life.

Dear NM Fish and Game,

As the Albuquerque Journal wrote about so clearly, the rules you are proposing for the hunting of cougars are not based on sound science and would not leave us with a sustainable cougar population.

As such, they also fail to reflect the values of conservation held by most New Mexicans.

Please DO NOT enact the proposed rules. Instead go back to the drawing board and come up with much more sustainable limits on hunting.

Many thanks,

Richard Skolnik

Dear New Mexico State Game Commission,

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and we support legal bear and cougar hunting (with the use of dogs) as an appropriate management tool. As caretakers of this trust, we believe you will advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

The proposed changes to the bear and cougar rule represent modest adjustments to the current rule which has been proven to maintain healthy and abundant populations of both species over time.

We respectfully request that the State Game Commission prioritizes the opinions of our dedicated department biologists and the recommendations developed from their science-based data such as non-invasive scat or hair sampling, remote/ trail cameras, GPS collars, and other traditional measures.

We have seen how politics and emotion has played a large part of laws being passed in California banning the use of dogs for mountain lion hunting and then outright banning the hunt altogether. Cougar attacks and populations then explode and become an issue which the government and state biologist then have to pay for depredation. Another example is New Jersey where black bear hunting is outlawed and due to this, there has been a spike in bear encounters which lead to bear having to be euthanized.

Very Respectfully,
Julian Orozco

I am a hunter, a fisher, a camper, a backpacker, fortunate to live in a country, and a state where I can do these things that are so important for me, my family, my friends.

Hunting and trapping is part of our package of rights as citizens of this country. It needs to be done responsibly and managed properly by professional wildlife managers, not by extremist political organizations that speak for a small minority of the actual population, or for political intreats that truly do not understand science.

Population of all species must be managed by these professionals, in order to continue the idea and ideals of conservation of resources. This includes management of predator populations such as bears and mountain lions. Hunting with a variety of weapons and tools is one means of maintaining this science, fact based control. This includes hunting with hounds in this state, and this practice should continue.

Please maximize the ability of this state to manage our wildlife populations by trained professional Game and Fish professionals.

Thank you,

William and Anita Gentry

Hello,

I am writing you today to let you know of my opinion on Bear and Cougar hunting in NM. I believe bear and cougar hunting is a VERY IMPORTANT part of habitat/animal management in NM. I believe hunting these animals NEEDS TO CONTINUE long into the future to ensure continued population control of bears and cougars and all the species they share the forests with. To many of any species in not a good thing, there needs to be a balance which can only be supported with hunting. In my opinion there are already to many bear and cougar which negatively effects the deer and elk population. As hunting other animals such as deer and elk we help the not only the habitat but help their population thrive as does hunting bear and cougar.

Once again please know of my opinion on these matters as a life long New Mexico resident hunter that continued hunting of bear and cougar is very very important, that I am AGAINST any changes that would not allow hunting of these subject animals

Respectfully,

Mike DePauli

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I support bear and cougar hunting with the use of hounds in New Mexico. I also support Fish and Games proposed rule changes.

Limiting the hunters' ability to reduce these predator populations not only affects the livelihood of outfitters, hunters, and ranchers, but also greatly decreases revenue received by the state by out of state hunters. Allowing the bear and cougar population to continue with no control leads to more disease in the predator population, more risk of unhealthy animals due to insufficient food supplies, and aggressive animals preying on livestock and becoming a danger to people as they roam to more populated areas.

Please continue to support bear and cougar hunts with hounds in New Mexico.

Thanks,
Jennifer Wolff

Dear Sirs,

Please do not increase hunting permits on black bear and cougars. These animals already are pressed to the edge of their historical ranges and are on the verge of becoming endangered. As people move further into these animals territory more are euthanized due to ignorant people feeding them then having them killed when those interactions become too intense. Limits need to be placed on humans not wild animals. Thank you for NOT INCREASING HUNTING PERMITS ON BEAR AND COUGAR!!!

Sincerely,

Christine M. Lowry

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I support the Game Department's proposed rule to continue allowing the responsible hunting of bears and cougars. If future hunting is prohibited, the population of both species will grow and with it the depredation of livestock and domestic pets. The biologists have years of experience and statistics to back up their proposal.

Anti-hunters won't be content until they've abolished all forms of taking game animals and the next generation of kids won't experience and understand the natural cycle of life.

Sincerely,

John Gillis

Please ban all large game hunting with dogs. with radio collars, atv's and packs of dogs there is no fair chase possibility with this type of hunting. dogs chase any and all game for miles without respite during times when the animals need to be putting on weight and works to weaken large game and make them more susceptible to death. in a successful hunt an animal is run for miles through rough terrain until it is treed at which point the "hunter" simply walks under the tree and shoots the exhausted animal. this tradition of hunting with dogs is outdated and needs to end immediately. thank you James Dyer

Sirs;

I would like to enter my opinion in favor of continuing bear and cougar hunts as currently regulated by the New Mexico Game and Fish Department. Well regulated harvesting of these animals maintains a balance that is good for both people and animals. If hunting is stopped then the numbers will likely grow to a point that will substantially increase the frequency of human-animal contact. When this happens they become nuisance animals and greatly increase the likely hood of injury to both people and animals.

Thank you for your consideration;

Michael S. Curtis MSES

Dear Humans

With the current state of the climate change I believe the bear and cougar populations are being controlled by nature's droughts and wildfires.

When will these animals quit being treated as objects? They are intelligent forms of life—we will never understand all their contributions to the web of Life. They should not be murdered just because of a number system.

Appalling that hunters are using dogs to track these animals for the kill—they should at least be given a fair chance in this sport called hunting.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I would like to submit a comment on the subject of state hunting rules for bear and cougar.

Current proposals to raise the kill quotas are not based on the best available science including the dangerous and rapidly changing climate conditions, namely heat, drought, wildfires, flooding, and loss of habitat.

I have lived next door to a rancher who frequently hunts bear and cougar with his hunting dogs for recreational sport and brags about the number and size of his trophies. This is so contrary to fair chase hunting principles.

Bears and cougars are an important part of the integrity of our ecosystems. Killing too many may impact their

populations for years to come. We have seen the benefit of reintroducing wolves into the Yellowstone National Park.

This is another predatory animal that has been almost hunted to extinction in this region because of antiquated policies.

Wildlife Management needs to base its decisions on the most recent sound scientific data and make their decisions from that perspective as well as share the Information with the public.

Thank you for your attention to my concerns,

Janet Snowden

I live in Datil New Mexico, A very rural part of the state. I am blessed to see elk herds in my yard and hear the coyotes in the night. I am an avid animal lover. I also support the humane and responsible management of predators and herds through responsible hunting practices.

It is unfortunate that we simply don't have enough space for everyone. I wish it were the case. If herds or populations go unchecked in the wild, the consequences are devastating- starvation, illness, overpopulation.

This applies to top of the food chain predators too. When there are limited food sources, they become emboldened and attack domestic animals in their search for food. I know firsthand. I have a territorial male cat in my neighborhood. He has stalked elderly neighbors, killed the neighbors' turkeys just feet from his home, and lives dangerously close to my home where I rescue horses.

Is he a beautiful and incredible creature? Absolutely. An over population however causes an imbalance in an already struggling ecosystem. We must be good and responsible stewards. Wise and intelligent management through hunting can be part of the solution.

Thank you,

Kelly Metcalfe- Smith

To whom it may concern,

I am writing to you in the hopes that you will take into consideration the importance of the bears and cougars to the ecosystems and all life. These beings are self-regulating, unlike people who are encroaching and over-populating this Earth. Killing the bears and cougars for trophy hunting, recreation, status, money and power does not say very much about people and their ethics. The hurt and pain and grief we cause these animals and others, only causes more conflict. We are pushing them out of their homes, taking the lives of family members and using horrific methods to do this. Using dogs with collars and killing them when they are cornered and exhausted is barbaric. With climate change in our midst, the effects it has on their lives and ours should tell us not to ignore the problems we have created and keep creating because of our selfish and ignorant ways.

Thank you for your time

To Whom it may concern,

I do not hunt bear or cougar in New Mexico but I am a large land owner (approximately 800 acres) in the Gallinas Canyon, NE of Las Vegas NW. I have personally witnessed both of these species on my property over the past 2 decades. I definitely see the value in continued monitoring and hunting of these species, in conjunction with wildlife biologist management protocols. These animals are needed to maintain a healthy ecosystem by keeping some of the other species in the area in check. Bottom line, I support continued hunting of Bear and Cougar in New Mexico.

October 19 2023

Dear Sir or Madam,

I wish to comment on the NM Game & Fish proposal to increase the hunting limits on both cougars and bears.

I am a lifelong outdoors recreation person. I have worked for multiple land management agencies across the western US. I have been witness to the loss of open space, habitat loss for threatened and endangered plants, as well as increased losses of native fish, plants, aquatic species, and mammals.

In addition, I have seen that most agencies have databases to track species. Unfortunately most agencies have not kept the kind of information systems that accurately record, over time, species counts. In addition, I suspect that in most areas, poaching is considerable although I do not have direct proof of this. Therefore it is difficult to realistically assess species numbers and err in over counting the animals that are out there.

In watching the Ken Burns show about Buffalo, one can see that much of the destruction came from those who enjoyed the sport of killing for its own sake. As far as I know, there is no reasonable need to kill mountain lions other than killing for its own sake. In addition, I do not believe that the mountain lion species are sustainable given the impact of human encroachment, habitat loss, poaching, etc.

I want to go on record as I oppose extending hunting limits on mountain lions and bears. I do not believe increased hunting limits are ethical and sustainable. I want to urge you to conserve our game species and stop further increased limits.

Sincerely
Candace Bogart.

Bears and cougars can co-exist with humans and unless they become aggressive, there is no need to increase a hunting quota at this point in time. All animals, including humans, are stressed by the changing climate and humans encroaching on animal habitat just adds to their survival and genetic difficulties.

Date: Sunday, July 16, 2023 6:47:53 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I'm writing to express my concern about DGF's proposed rules for cougar and bear hunting.

First of all, I feel strongly that it should not be legal to hunt bears and cougars with dogs. Almost everyone finds it repulsive. You should honor majority public opinion by making it illegal.

Also, there is controversy and a lack of transparency about how population estimates have been determined for both cougars and bears. This is bad public policy. And those estimates apparently do not factor in the effects of climate change such as increased droughts and wildfires.. This makes no sense at all and will obviously lead to quotas that are too high!

The uncertainty of future habitat loss and climate change alone should cause you to err on the side of reducing kill quotas rather than increasing them, at least until the population estimates can be reviewed by independent wildlife experts. If you allow too many to be killed, it could begin a downward spiral that could take many years to reverse.

I implore you to reconsider your proposed quotas.

Thank you for your consideration.

Dear Game and Fish,

I was very distressed to hear of the proposed limits on mountain lion hunts. Your plans sacrifice **too many** lions. It has been such a hard few years with the drought and many of their food sources are limited and/or decreasing. Although I am no expert, I am sure that there have been more deaths among the lion population simply from natural causes. There are natural regulatory forces for animals that control the populations. Why add the stress of out-of-state yahoos with all their gear? Most of those people can't shoot anyway and leave wounded animals and trash behind.

Our lions are a wonderful part of our state. We are so lucky to have big wild chunks of state left, and the animals that go with it. Mountain lions are a keystone species, and to take so many of them out of the picture will have unintended and negative impacts.

I would like to add my voice to others to ask you to reconsider, **and greatly lower**, the numbers of lions that you propose to allow to be killed.

thank you,

M. Alison Hull

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

This email is to respond to the proposed increase in hunting limits on bears and cougars.

I am against this proposal and have some very pertinent experience with bears and cougars in New Mexico. I live in an inholding in the Santa Fe National Forest , well into the forest (on Forest Road 312, near LLaves). I have lived here since 2002. I hike extensively in the forest in all four seasons. I have NEVER encountered a cougar. I have encountered very few bears. I have noticed the decline in the deer and elk population in our area and am in a good position to notice. I have never been bothered by a bear at my residence, even though I maintain a stock tank and have, for years, put out feed for horses.

I cannot fathom why you might wish to increase licenses and harvest limits for hunting these wild animals. Wild animals are endangered all over the world. New Mexico is one of the few places in this country that has the potential to be a reservoir and haven for the few wild animals that are left. Please do not eliminate these animals from our forests.

Dear Commissioners,

Wildlife resources are an invaluable asset for us all. Grounding wildlife management in the North American Model and the Public Trust Doctrine ensures sustainability. Bear and cougar hunting, when executed responsibly, is an important tool. Let's remain committed to evidence-based approaches and prioritize long-term sustainability. I support bear and cougar hunting.

Subject: [EXTERNAL] letter in support of hunting bears and cougars in New Mexico
Date: Thursday, August 24, 2023 3:42:25 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I am writing to express my support for the continued management and hunting of New Mexico black bear and cougar populations based on data gathered and analyzed by biologists rather than the opinions of people who largely oppose hunting because they believe it is immoral, not because they believe that these populations are in any danger.

The North American Model and the Public Trust Doctrine define fish and wildlife resources as the property of the people, to be managed by state and federal wildlife agencies entrusted with their stewardship. This model is the foundation of science-based fish and wildlife management, and I support legal bear and cougar hunting as an appropriate management tool. As caretakers of this trust, I implore you to advance sound stewardship policies that are guided by science over politics, emotion and conjecture.

Thank you,

Andy Johnson

Subject: [EXTERNAL] on proposed BEAR AND COUGAR Rule changes
Date: Sunday, July 30, 2023 5:07:30 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Glad Im a subscriber to the Abq Journal, and learned about this proposed 'rule change' about Bear and Cougar execution in NM via today's newspaper. The Wildlife in our beautiful state is not "Owned" by the government its entities or wildlife life management agency.

We are NOT overrun by bear or cougar-- (who manage their own populations with respect to food, water and habitat).

Rather, we should be in the business of HUMANELY managing ---not killing our wildlife --- as we are living in a time of mass animal extinction.

Raffling off life of our native critters is short-sighted and without scientific basis or merit. I would like to know that wildlife Management does NOT approve of killing bear or cougar IN LIEU of Relocating those that must be? ...or helicopter executions of feral cattle left to ROT in the forests, because said cattle was a source of "non point contamination" of our streams?

and that every time a resident, most often newly transplanted folks from out of state, freak out because a neighbor mentioned a bear or cougar ..they learn just like the rest of us, that THE ANIMALS were here First and we **CAN LIVE and LET LIVE** in peace and **mutual co-existence**. At least that is the hope..we are not a State-run Game Ranch like the canned 'hunts' they do in Texas..It is unethical, immoral and down right wrong and wasteful to take a life because one has weapons but not heart.

Please take CARE of our wildlife. In my understanding 'care' does **not** include (convenient) executions.

Sincerely

Subject: [EXTERNAL] please DO NOT increase harvest limits for bears and cougars
Date: Sunday, July 16, 2023 9:23:53 AM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Dear NMGF--

I have reviewed the Bear and Cougar Rule--Initial Proposed Changes Summary and am writing to urge you to reject increasing harvest limits for these animals.

I live in Los Alamos, and have seen the profound impact of climate change, drought and wildfire on the habitats and behaviors of our local bears and cougars. Conflicts with humans (including pet and livestock depredation) has resulted in the relocation or killing of many animals in recent years. This is not surprising, as Los Alamos has some of the only unburned forest remaining in the region.

These animals are struggling, and as the effects of climate change rapidly accelerate, will only struggle more in future. It seems completely inappropriate to add additional hunting pressure to these animals' list of survival challenges.

Please do not increase hunting limits, but instead work harder to preserve and increase populations of our important large animals.

Thanks very much for your attention to this matter, and for all that you do for NM wildlife!

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

I oppose the proposed bear and cougar rules. I have not seen any substantive and wide-ranging (rather than in isolated areas) studies with reliable/well studied data including bear or cougar populations that would support increasing kill quotas and the length of the hunting season. Additionally, we are experiencing extended and substantial drought, already putting pressure on all animal populations, especially top predators. Killing more of these top predators can impact their populations for a very long time. They provide crucial roles in balancing our ecosystems by keeping rodent and deer populations in check.

New Mexico Game & Fish should ban the use of dogs in cougar and bear hunting due to its cruelty. New Mexico Game & Fish should lower the number of cougars the kill quotas and should not extend the hunting season.

To whom it may concern;

I have held a life long enmity for casual hunting practices which are not geared toward providing food or responsible protection of livestock;i.e. trophy hunting. I shall not belabor my thoughts in this regard but rather present a notion long espoused by our Native population which entails the balance in our natural world and the notion that we share this earth with an abundance of fellow living creatures. I cannot speak eloquently on this matter-I refer you to the book Braiding Sweetgrass by Robin Wall Kimmerer for a wonderful exposition on this concept. I write to implore you to please consider this concept-i.e sharing of the earth with our fellow wild creatures-when you gather to decide the rules regarding hunting limits. The loss of any wild being naturally diminishes us all;the loss of a wild creature by virtue of intention in the pursuit of trophies is an atrocity.

Thank you for your attention to this matter.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

After reading the article by Charles Fox in the Albuquerque Journal of July 30th, I was appalled to learn that the NM Dept. of Fish and Game were proposing to kill up to a quarter of bears and cougars in New Mexico. Why would this be done? I can understand removing nuisance bears to places where they would not do damage or scare people, cause any kind of harm. AS for cougars, they are elusive animals and since heir numbers are low, seldom cause a problem. But what is this proposal based on? Do we even have good numbers of just how many bears and cougars we have in our state? I would like to see some answers printed in the Albuquerque Journal.

Our state is blessed with a great variety of wildlife and I would hate to see the loss of any species due to indiscriminate killing of them.

Thank you. Ms. Pat Manaster in Albuquerque

To whom it may concern

Please do not raise kill quotas on cougars and bears in New Mexico. Their population numbers are very uncertain, and they are facing a number of other threats including climate change and habitat loss. Predators at the top of the food chain do not need to be "managed" through hunting. Their numbers will always be controlled by the population of their food sources. Use your taxpayer-funded resources to study these animals and monitor populations in a scientific manner.

Thank you.

David

Hi,

Please do not raise the quotas for killing bears in this state. Also cease these outrageous quotas for killing cougars. I was astonished to see how many cougars are killed in NM every year when I looked this up on the state site. These animals are being killed for trophies, not for any other purpose. You should use scientific knowledge when making these rules. The game animals belong to all of us whether we hunt or not. So far you are generally representing only those killing our animals. More of us do not believe this should occur. So let us be more representative of the majority's feelings in these matters.

Date: Wednesday, August 16, 2023 5:30:51 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Please increase the number of permits for bear and cougar hunting. The number of bears has increased dramatically in the past 5 decades I've been hunting in NM. The first bear I ever saw in the wild was in my tent. On one hunting trip my friend and I saw 10 bears. That is too many. In places like Valle Vidal, the bears are wiping out the elk calves. Not many hunters hunt bear or cougar, because to be really effective at it, you need dogs. Bear and lion dogs are few and far between these days. Allowing bear hunting while deer and elk hunting was a good decision, but cutting off the hunt based on a number of females taken is ridiculous.

I've had 5 cougar encounters, with two of them being up close and personal. I now carry a gun in the woods at all times. A large number of bears and cougars in the woods creates a safety issue for children. When I was a Boy Scout, it wasn't an issue, because predators were treated as the problem they are.

To whom it may concern,

I am writing to express my concern about the rules that are in place and the changes that the Department of Game and Fish are proposing.

I do not think that the cougars and bears in our beautiful state should be "managed" by slaughtering them by a few individuals who pay for their blood-sport. These majestic animals deserve to live and exist as an integral part of our and their environment without being tagged for death as a so-called "sport".

It is hard enough for them to exist and be part of our ecosystem without the Department letting them be "harvested". This is not management. It is letting a few destroy the beauty and diversity of our wild lands for their cruel and disgusting "enjoyment".

I hope you are wise enough to let these animals simply exist in their world as they evolved to do. Your part should be enabling their existence, not destroying it. I hope you have the wisdom and foresight to change the policies of the department to reflect the lives of the wild beings that you have been entrusted to protect.

Dear Sirs/Madams,

First I shall say I am an advocate for allowing animals to live full, wild lives as much as possible. I would like to see Fish & Game advocate for NOT killing animals, especially cougar and bear, for example.

And call it what it is : killing. Not for food or even protection, but for "sport". Our wildlife populations are already suffering immensely from the effects of fires, human population encroachment and climate change. I would like to see your agency help them survive and not be hunted down and killed.

We need not to kill more, but to support and assist our wild creatures to live, flourish and have good lives.

Thank you for considering my input.

Subject: [EXTERNAL] "Proposal for increasing Bear Hunting", My comments and Disagreements w this proposal
Date: Monday, October 9, 2023 5:44:27 PM

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

To NM Game and Fish: Aug 25,2023 dept. of game and fish meeting in Raton, Nm commissioners heard public comments from NM cattle growers, farm and livestock bureau, hunting guides,houndsmen, and trappers. I am Requesting a Public Hearing be held in Silver city area so we can address our concerns about the increased killing of bears from 146 to 197 in the Gila. Then I also have to wonder what new increases might be asked for further killing of NM/Gila Cougar.... Both this area's and other areas of NM's Bear And Cougar.... A most precious and beautiful life in Nature ... Two incredible species who need to be protected And fully appreciated! So there were comments heard from those who look at these lives as commodities.... Not valuing or fully appreciating NM's Bear and Cougar.... And then trapping to have taken place, shame and I hope Entirely No More of such barbaric actions... And so the excuse to increase hunting?!? I along w many other residents And visitors/tourists So Enjoy exploring this magnificent Gila, Also other areas of this "Land of Enchantment" And, to be able to watch/see these incredible Wild animals on their land/environment Living Their lives is an incredible gift.... Last yr on hiking the Hillsboro Peak trail off Emory Pass lookout I had the incredible gift bestowed upon me by this Earth to watch a Mamma bear and her 3 cubs swim and play in a monsoon rain pocket lake area at the foot of these Mtns.... Lakes created that season due to trapped monsoon rains.... To watch that Bear Family live, swim, play together in their Life is something that will forever be held in my heart.... America sadly has the Ill mentality that everything should be Hunted/Killed, have a hunting season ... In all this extinction and decrease of wildlife isn't it Time to stand up For This Precious Wildlife, End all this desecration of Life, Which Also Has The Right to Life Upon This Earth....?!?!? And Why aren't killings of bear/cougar by Wildlife Services in Grant county, And beyond, Not included in your maximum limits? Wildlife Services in Grant county are shooting bear and Cougar for the cattle industry... Why is there no RELOCATION happening?!?!?!? Instead it's only killing! The Two Year contract is for Relocation HASNT HAPPENED! Their killings Must Be Added to your quota limits, Not just in the Gila, but All Wildlife Service's killings of bear and cougar from around the state! WHY are there not more game wardens out in the field , To watch for poaching, help the public, keep a sharp eye out for Illegal New Roads created for harvesting firewood, etc, etc ...?!?!? I AM SAYING NO TO INCREASED KILL QUOTAS! AND, I AM ALSO REQUESTING A PUBLIC HEARING BE HELD. It is time to remember this Earth and life are not only for the human race but, ALSO for Earth's precious Wildlife And Their Right To Life As Well. Thankyou,I look forward to a Public Hearing and,your comments. Christine A. Hess

8/18/2023

Hello Game & Fish Department,

I have become aware of the evaluation of numbers regarding hunting bear and cougar in NM currently being evaluated.

I wish to express my opposition to the killing of either bear or cougar in NM. These wild creatures have a purpose and place in our environment. I have been privileged to see both of these creatures out in the wild, and I regard them as sacred animals.

There is plenty of deer and elk for hunters in NM I believe to satisfy hunting needs in terms of large game.

Thank you for considering my ~~opinion~~ opinion.

Re: Bear & Cougar Rule Proposed Changes

Dear Staff:

We are writing you on behalf of the Great Old Broads for Wilderness, Aldo's Silver City Broadband, a non-profit, all-volunteer organization focusing on education about, and advocacy for, public lands, especially wilderness. We are based in the heart of the Gila/Aldo Wilderness regions, and are an affiliated chapter of a national organization headquartered in Durango, CO, with over forty chapters nationwide. Our grassroots organization, led by women, works to preserve and protect wilderness and wild lands.

We are writing to express our concerns about your new quotas and schedules for bear and cougar hunting in New Mexico. While your proposed changes to the quotas are mixed, the overall numbers to be killed are higher.

Bears and cougars are now known to be extremely important to the integrity of our ecosystems. Both species are known to self-regulate their own numbers, so erring on the side of killing fewer of these animals is better. Killing too many can lead to more conflict over territory.

Killing bears and cougars at random for recreation and trophies does not help address conflict with humans. In fact, it may exacerbate conflict. Trophy hunters typically target larger, established individuals for their kills, disrupting their social structures. Bears and cougars are territorial animals, and if an individual who is not involved in conflict is killed, a younger and less experienced individual who is more prone to conflicts may move into the vacant territory.

Both bears and cougars are frequently hunted using dogs that chase them until the exhausted animal seeks refuge and rest by climbing a tree. The hunter will then find the dogs by using their electronic collar signals as they keep the animal treed. When these hunters arrive at the scene, they will shoot the animal at point blank range. Even segments of the hunting community find this practice contrary to Fair Chase hunting principles.

We have looked into your reports about bear and cougar numbers (such as your "2023-24 Cougar Harvest Update"), and it is unclear where these populations stand in 2023 as it appears that you estimate their population by extrapolating from limited study areas to broader regions. Although sustainable harvest limits and harvests are clearly shown in these charts, there are no actual population totals (or quota percentages) shown for either mammal.

Considering these issues and facts, we ask that you implement the following rules:

- The hunting quotas for bears and cougars are reduced or kept as now, in recognition of the ecological benefits of these large animals.
- The lengths of bear and cougar hunting seasons remain as now, which will protect the animals and their genetic diversity, and will additionally protect other public uses of public lands.
- Non-resident hunting of bear and cougar is forbidden.
- The use of hounds in bear and cougar hunting is forbidden.
- Hunters of elk, deer and other game are prohibited from opportunistically shooting bears and cougars.

We understand that you have a traditional alliance with hunters so that they have a great deal of influence with your work, but we would like to see bird watchers, campers, backpackers, and hikers be included in your concerns. In addition, Southwest New Mexico has numerous businesses which depend on tourists who come here for the wilderness experience. We believe these groups make up a larger percentage of New Mexicans who are concerned with wildlife numbers in the forests of New Mexico than hunters.

Thank you for your consideration.

Sincerely,

The block contains two handwritten signatures in blue ink. The first signature, 'Marcia Stout', is written in a cursive style. The second signature, 'Denise Smith', is also in cursive and appears to be written below the first.

Re: Opposition to Proposed Rule 9.31.11 NMAC
Do Not Increase Kill Limits for Bears and Cougars

Dear Commissioners:

I write to urge the Commission not to increase kill limits for bear and cougar trophy hunts. There are few scientifically rigorous studies of New Mexico's bears and cougars, and limited empirical data exists. Therefore, this proposal cannot be based on science.

Trophy hunts are not for food. There is no good reason for trophy hunts.

Kill limits for cougar and bear trophy hunts should not be increased, but on the contrary, should be reduced by 50%, to account for the population stress they have been under due to fires and climate change.

Cougars and bears belong to all New Mexicans and the majority of New Mexicans oppose trophy hunts. This rule should not be passed.

Thank you,

Christine Schwamberger

COMMISSION MEETING AGENDA BRIEFING

Meeting Date: October 27, 2023

Agenda Number: 7

Presenter: Stewart Liley

Corroborator: N/A

Agenda Title: Hearing on the Bear and Cougar Rule 19.31.11

1. Summary of Agenda Item

The Department will present on proposed changes to the Bear and Cougar rule (19.31.11 NMAC) based on public comment, harvest data, and biological data collected from research in New Mexico and recent literature. Proposed changes will include aligning harvest limits with recent biological data.

2. Background Information

The Department is in the rule development process for the Bear and Cougar rule because the current 4-year Rule expires on April 1, 2024. Proposed changes to the Bear and Cougar Rule are made based on current scientific findings using the results of Department and collaborator research efforts in New Mexico, recent findings in the literature, and Department staff and public observations and recommendations. Harvest limits are set at a percentage of the zone-specific population estimate, which maintains sustainable population sizes while allowing hunting opportunity. Bear population estimates are derived using population density estimates from studies conducted in various locations in New Mexico. Bear population density estimates were updated in April 2023 for two bear management zones based on Department efforts using advanced genetic and statistical modeling techniques. Cougar population estimates are derived using density estimates from studies conducted in New Mexico, and estimates in the literature for nearby arid areas. In most zones, cougar habitat is ranked according to quality, and an appropriate density estimate is applied to each of the habitat types to derive a zone-specific population estimate. In some zones, cougar population density estimates are currently being updated using data collected from ongoing intensive capture and camera trapping efforts, and advanced statistical modeling that determines a density estimate across all habitat types in a zone. Monitoring of age and sex structure through data collected from harvested animals, as well as data on harvest effort provided by hunters, boosts understanding of population trends, especially in the years and areas for which there aren't recent population density estimates.

Specific proposed changes include:

- Increase the harvest limits in Bear Management Zone 1 (current: 158; proposed: 168) and Bear Management Zone 10 (current: 146; proposed: 197) based on population estimates from new NMDGF research.
- Move GMU 57 from BMZ 7 to BMZ 5, and move GMUs 56 and 58 from BMZ 7 to BMZ 6, thus dissolving BMZ 7.
- Increase the number of permits for bear draw hunts BER-1-103 and BER-1-104.

- Move the season start date for BMZs 12 and 13 from September 1st back to August 16th.
- Decrease the harvest limit in Cougar Management Zone Q (current: 34; proposed: 17) based on population estimates from new NMDGF research.
- Allow licensed deer or elk hunters who draw WMA hunts to harvest a bear or lion during their hunt if the zone is open and they possess a Bear and/or Cougar license.

3. Strategic Plan References and Possible Impacts of Agenda Item

The process as presented to the Commission meets the Conservation Services Program Objectives 1, 2 and 5 of the Department's Strategic Plan: FY 2019 – FY 2023

4. Considerations Regarding Duplications and/or Conflicts with Existing Rules or Statutes

None

5. Description and Summary of Public Involvement Process and Results

The Department posted via its website the proposed changes, and public meetings were held in Raton, Albuquerque, Las Cruces, and Roswell in July. Meetings with stakeholder groups were held, which will be summarized for the Commission. The Department has received 2,790 public comments as of October 20, 2023 via the DGF-Bear-Cougar-Rules@state.nm.us email address and by written comment. The Department disseminated, via reports on its website and through social media content, the results of research conducted over the past 5 years to assess bear and cougar populations in parts of the state where changes are being proposed.

6. Suggested Motion

The Department respectfully suggests the following motion unless Commission discretion indicates a different course of action:

“Move to adopt the proposed changes to 19.31.11 NMAC as presented by the Department and allow the Department to make minor corrections to comply with filing this rule with State Records and Archives.”

TITLE 19 NATURAL RESOURCES AND WILDLIFE
CHAPTER 31 HUNTING AND FISHING
PART 11 BEAR AND COUGAR

19.31.11.1 ISSUING AGENCY: New Mexico department of game and fish.
[19.31.11.1 NMAC - Rp, 19.31.11.1 NMAC, 4/1/2024]

19.31.11.2 SCOPE: Sportspersons interested in bear and cougar management and hunting. Additional requirements may be found in Chapter 17 NMSA 1978 and Title 19 NMAC.
[19.31.11.2 NMAC - Rp, 19.31.11.2 NMAC, 4/1/2024]

19.31.11.3 STATUTORY AUTHORITY: 17-1-14 and 17-1-26 NMSA 1978 provide that the New Mexico state game commission has the authority to establish rules and regulations that it may deem necessary to carry out the purpose of Chapter 17 NMSA 1978 and all other acts pertaining to protected mammals, birds, and fish.
[19.31.11.3 NMAC - Rp, 19.31.11.3 NMAC, 4/1/2024]

19.31.11.4 DURATION: April 1, 20202024 through March 31, 20242028.
[19.31.11.4 NMAC - Rp, 19.31.11.4 NMAC, 4/1/2024]

19.31.11.5 EFFECTIVE DATE: April 1, 20202024, unless a later date is cited at the end of a section.
[19.31.11.5 NMAC - Rp, 19.31.11.5 NMAC, 4/1/2024]

19.31.11.6 OBJECTIVE: Establishing open hunting seasons and regulations, rules and procedures governing the distribution and issuance of bear and cougar licenses and permits by the department.
[19.31.11.6 NMAC - Rp, 19.31.11.6 NMAC, 4/1/2024]

19.31.11.7 DEFINITIONS:

A. “Bear entry permit” shall mean a permit awarded through a public drawing which entitles the holder of an over-the-counter bear license to hunt in a limited entry area during season dates established in rule.

B. “Bear zones” shall define-mean hunt areas consisting of one or more game management units as described in 19.30.4 NMAC.

C. “Cougar zones” shall define-mean hunt areas consisting of one or more game management units as described in 19.30.4 NMAC.

D. “Department” shall mean the New Mexico department of game and fish.

E. “Director” shall mean the director of the New Mexico department of game and fish.

F. “Game management unit” or “GMU” shall mean those areas as described in 19.30.4 NMAC.

G. “Wildlife management areas” or “WMAs” shall mean those areas as described in 19.34.5 NMAC.

[19.31.11.7 NMAC - Rp, 19.31.11.7 NMAC, 4/1/2024]

19.31.11.8 ADJUSTMENT OF LICENSES, PERMITS AND HARVEST LIMITS:

A. The director, with verbal concurrence of the chairperson or their designee, may adjust the number of licenses, permits or harvest limits, up or down by no more than twenty percent within a bear zone or cougar zone, to address critical department management needs, significant changes in population levels or habitat availability. This adjustment may be applied for bear and cougar within the specified zones to any or all of: the specific hunt codes; total harvest limits; or female harvest sub-limits.

B. The director, with verbal concurrence of the chairperson or their designee, may take management actions independent of seasons and restrictions, harvest limits or female sub-limits for population management, or to address critical situations including ungulate population protection, depredation, human health and safety or other wildlife management issues. The decision to take management actions pursuant to this subsection shall be reported to the commission.

[19.31.11.8 NMAC - Rp, 19.31.11.8 NMAC, 4/1/2024]

19.31.11.9 BEAR AND COUGAR LICENSE APPLICATION REQUIREMENTS AND RESTRICTIONS:

A. Bear entry hunt: It shall be unlawful to hunt bear in designated wildlife management areas or other specifically designated special entry hunt areas without having a valid bear entry permit and a valid

bear license in the hunter's possession or as otherwise allowed by game commission rule. Bear entry hunters shall be allowed to hunt in any other open bear zone provided they have a valid bear license.

B. Mandatory cougar identification course: All persons shall complete the mandatory cougar identification course offered on the department's website prior to purchasing a cougar license. [19.31.11.9 NMAC - Rp, 19.31.11.10 NMAC, 4/1/2020]

19.31.11.9 [RESERVED]

[19.31.11.9 NMAC - Repealed, 4/1/2024]

19.31.11.10 BEAR AND COUGAR ZONE CLOSURES, BAG LIMITS AND AREA CLOSURES RESTRICTIONS:

A. Zone closures: Bear and cougar may be hunted or taken only in zones designated as open on the department hotline or website. Zones will close within 72 hours of when the reported number of bears or cougars harvested is within ten percent of the total limit or female sub-limit for that zone, whichever occurs first.

B. Bag limit: The bag limit for bear is one; the bag limit for cougar is two. It is unlawful to kill a bear sow with cub(s) or any bear cub less than one year old, or to kill a spotted cougar kitten or any female cougar accompanied by spotted kitten(s).

C. ~~Areas closed to bear and cougar hunting~~ Limited entry hunt areas: ~~It shall be unlawful to hunt bear or cougar in designated WMAs or other specifically designated special entry hunt areas with the following exceptions:~~

(1) ~~Legally licensed bear hunters possessing a valid bear entry hunt permit may hunt bears in the area(s) specified on the permit, or as otherwise allowed by rule. Bear entry hunters shall be allowed to hunt in any other open bear zone provided they have a valid bear license.~~

(2) ~~Legally licensed deer and elk hunters whose license is valid on a WMA or the Valle Vidal and are in possession of a valid over-the-counter bear or cougar license, may hunt bear or cougar in the WMA or the Valle Vidal as specified on their deer or elk license. Deer or elk hunters choosing to hunt bear or cougar under this provision may not use dogs, may hunt only in open bear or cougar zones, and must adhere to the weapon type restriction and season dates as specified by their deer or elk licenses.~~

D. Cougar hunting requirements and restrictions:

(1) ~~All persons shall complete the mandatory cougar identification course offered on the department's website prior to purchasing a cougar license.~~

(2) ~~Cougar hunting is closed in the Florida mountains hunt area during any open Persian ibex season, except by legally licensed Persian ibex hunters in possession of a valid cougar license. Persian ibex hunters may hunt cougar only if the cougar zone is open, and must adhere to the weapon type restrictions and season dates as specified by their Persian ibex license.~~

C. ~~Areas closed to bear and cougar hunting:~~ ~~Limited entry hunt areas listed in 19.31.11 NMAC are closed to over-the-counter bear hunters who do not possess an entry permit. Cougar hunting in these areas is allowed only by licensed deer or elk hunters in possession of a valid cougar license in the E.S. Barker, Colin Neblett, Humphries, Marquez, Sargent, and Urraca WMAs, and the Valle Vidal. Deer or elk hunters choosing to hunt cougar under this provision may not use dogs, may only hunt in open cougar zones, and must adhere to the weapon type restriction and season dates as specified by their deer or elk licenses. Cougar hunting is closed in the Florida mountains hunt area during any open Persian ibex season, except by legal Persian ibex hunters in possession of a valid cougar license. Persian ibex hunters may only hunt cougar if the cougar zone is open, and must adhere to the weapon type restrictions and season dates as specified by their Persian ibex license.~~

[19.31.11.10 NMAC - Rp, 19.31.11.10 NMAC, 4/1/2024]

19.31.11.11 BEAR HUNTING SEASONS:

A. Over-the-counter bear hunts for the ~~2020-21~~2024-25 through ~~2023-24~~2027-28 seasons: The following table lists bear zones, open GMUs, ~~weapon type~~ sporting arm restrictions, season dates, total harvest limits, and female harvest sub-limits.
